ACKNOWLEDGEMENTS

This project focuses on the development of a web application designed for auditing university financial records to ensure accuracy and regulation. Traditionally, this auditing process has been performed manually, involving numerous paperwork and time consuming. However, nowadays technology has enabled us to create a web application audit system, making it more efficient and simple. These tools are essential due to the complexity and numerous data associated with university auditing finances documents. The goal for this project was to replace the traditional audit process with a more refined and effective solution, utilization of technology to enhance accuracy and efficiency.

The successful completion of this project can be attributed to the invaluable assistance and unwavering support extended by numerous individuals. We wish to extend our sincere gratitude to all those involved. Paramount to our achievements was the guidance and expertise generously provided by our advisor, LECT. PAGAPORN PENGSAK. Additionally, we express our profound appreciation to the Faculty of Information Technology and Communication at Mahidol University, Thailand. The accomplishments of this project would not have been possible without the crucial support mentioned earlier.

ABSTRACT

AUDITING MAHIDOL UNIVERSITY'S AUDIT TECHNIQUE HAS TRADITIONALLY BEEN A MANUAL PROCESS, REQUIRING A LOT OF PAPERWORK AND TIME CONSUMING. THE PURPOSE OF THIS PROJECT IS TO PROVIDE A WEB APPLICATION THAT FACILITATES THE AUDITING OF FINANCIAL RECORDS AT MAHIDOL UNIVERSITY IN ORDER TO ASSURE CORRECTNESS AND STANDARD WITH REGULATIONS. THE APPLICATION INCLUDES FEATURES FOR DATA STORAGE AND RETRIEVAL, AS WELL AS HANDLING FREQUENTLY USED DATA TO REDUCE CRITICAL PROCESSES, ALL DESIGNED TO HANDLE THE COMPLEXITY AND NUMEROUS OF UNIVERSITY AUDITING DOCUMENTS. OUR GOAL IS TO IMPROVE BOTH THE PRECISION AND RELIABILITY OF FINANCIAL AUDITS WHILE REDUCING COSTS AND SAVING TIME. MOREOVER, THE WEB APPLICATION IS DESIGNED TO BE USER-FRIENDLY AND EASY TO INTEGRATE INTO EXISTING AUDITING SYSTEMS. MOREOVER, THIS PROJECT SEEKS TO PROVIDE A MORE EFFECTIVE AND EFFICIENT AUDITING EXPERIENCE, HELPING TO ENSURE FINANCIAL INTEGRITY AND TRANSPARENCY.

CHAPTER 1

INTRODUCTION

1.1 Motivation

The internal audit system is essential for every organization, including the university. Traditional auditing is now done manually and has several drawbacks that have caused disadvantageous impacts. Some examples of the negative effects include human error, inefficiency and time-consuming, limited scalability or struggle to handle increased volumes of data and audit tasks, difficulty in data analysis, the lack of time responding, and difficulty in collaboration. These are the motivations to use technology to make positive changes, improve workflows, reduce manual errors, and enhance the overall effectiveness of the web application for the university's internal audit system. The main focus of this project is to help auditors by creating a web application for the internal audit system of the university that is a more efficient, transparent, and responsive auditing process. Auditors can select Audit plans, access documentation, start auditing projects and data processing, and track and monitor the systems, and reports. Moreover, the purpose of these features is to help with auditor workflows and enhance the overall internal audit system. In addition to its technical features, this project provides an opportunity for collaboration and skill development. It encourages teamwork. The development of a web application for the university's internal audit system demonstrates our dedication to continuous improvement, innovation, and adapting to the evolving system. In the future, this web application for the university's internal audit system is an opportunity for the user to improve and add more features or even expand the ability to assist the auditor.

1.2 Problem Statement

- **Identification of Current Issues:** Begin by identifying and succinctly describing the key issues and challenges prevalent in the current internal audit system. This may include manual and time-consuming processes, decentralized data management, a lack of real-time insights, and the potential for errors in the auditing procedures.
- **Impact on Efficiency and Accuracy:** Delve into the consequences of the identified issues on the efficiency and accuracy of the internal audit processes. Discuss how the current system may result in delays, hinder timely decision-making, and potentially compromise the accuracy of audit findings. Emphasize the need for a more streamlined and automated approach to mitigate these challenges.
- **Transparency and Compliance Concerns:** Address any transparency and compliance concerns associated with the current system. Explore how a lack of centralized data may hinder transparency, making it challenging to ensure adherence to regulatory standards and internal policies. Highlight the importance of instilling confidence among stakeholders in the integrity of the audit processes.
- **Resource Allocation and Workload:** Discuss the allocation of human and financial resources required for the maintenance of the current system. Highlight any inefficiencies in resource utilization, such as excessive manual efforts and redundancies. Consider the impact on the workload of audit teams and how a streamlined web application could optimize resource allocation.
- **Adaptability to Technological Advancements:** Acknowledge the rapid evolution of technology and its implications for internal auditing. Discuss how the current system may struggle to keep pace with technological advancements, potentially resulting in outdated practices. Emphasize the necessity of a web application that is not only contemporary but also adaptable to future technological shifts.

1.3 Objectives of the Project

- To perform an internal audit used for reference and systematically raise the quality of the internal auditing of the university

1.4 Scope of the Project

- The scope of our project is to use a Web application to help create Audit plans.
- Web application It will facilitate users by organizing Audit plans. Documentation Verification notification Processing in various formats

1.5 Expected Benefits

- All internal auditors at the university perform their duties in accordance with guidelines appropriate to Mahidol University.
- All internal auditors at the university perform their duties. The results of the internal audit are of high quality according to internal audit standards. and able to respond to the needs of those involved, such as those who support various budgets and executives at all levels, in accordance with guidelines appropriate to Mahidol University.
- The internal audit process has appropriate steps. and can be continuously developed to be more efficient.
- The university's departments and agencies recognize all internal auditors at the university.

1.6 Organization of the Document

This document consists of 6 chapters including:

1. Introduction – Introduction contains 6 sections, including project motivation, problem statement, objective, scope of the project, expected benefits, and document organization.

2. Background – Background describes the background and related work of the project.
3. Analysis and Design – Analysis and Design describes the process of the project, methodology, and system architecture represented by a diagram, structure chart, data flow diagram, database design, and I/O design.
4. Implementation – The last chapter consists of five sections which are the conclusion, benefits, problems and limitations, challenges of the project, and future work.
5. Testing and Evaluation – This chapter discusses usability testing.
6. Conclusion – The last chapter consists of five sections which are the conclusion, benefits, problems and limitations, challenges of the project, and future work.

CHAPTER 2

BACKGROUND

The goal of the audit web application project is to develop a web audit application for Mahidol University to improve the efficiency and accuracy of financial auditing processes. Traditional manual audits are prone to human error, requiring significant time and resources. The feature of this web audit application will reduce paperwork and travel costs while ensuring compliance with ISO 19011 standards for auditing management systems. Key features include data storage and retrieval, comprehensive reporting capabilities, and a user-friendly interface. The application seeks to meet user expectations in developing the audit web application while following international auditing standards and meeting user requirements in developing the audit web application.

2.1 User requirement

2.1.1 On the Audit side

1. Preparation of an audit plan
2. Long-term plan (4 years)
3. Annual plan

condition

- User is the importer of factors for planning.
- system is processed into long-term and annual plans.
- Users can adjust the map that the system has already processed (both long-term and yearly).

2.1.2 Preparation of project Audit documents

- Audit request letter
- Engagement Plan
- Schedule
- PowerPoint Open Audit
- Routing Slip

condition

- Let the system have a form according to 1.2.1 - 1.2.5, which has a key field for the system to fill out according to the information in the plan, but the user can be modified.
- In every fiscal year, let the user choose the annual plan (1.1.2) to proceed. Then set the time that the system will issue a request for Audit (1.2.1), such as 21 days before the start date, and be effective with all audit projects (audit job) in that plan. On the due date, give The system assigns the project code. Issue a request to check (1.2.1) delivered to the specified email and save the file in the job folder.
- Issue Engagement Plan, Schedule, and PowerPoint (1.2.2 - 1.2.4) at the Save File system in that job folder as well.
- User retrieves documents 1.2.2 - 1.2.4 and edit or increase data to print out.
- On the day of the Audit (as specified by the plan), the User's right to choose Audit Job to start checking and click "START"
- The system starts counting Audit Project Start Date (Fieldwork) and saves the data in Routing Slip (1.2.5).
- User identifies the status of the project that can be checked, such as in the process of field Audit. In the process of drafting reports, etc. by processing from the data in Routing Slip

2.1.3 Processing to randomize data for verification

condition

- Users can import data from outside, such as Excel files, reports from the MU-ERP system and others with similar characteristics, etc.
- Users can set random conditions such as maximum, minimum, number of items, etc.
- The system shows the sampling results along with the conditions that the user determines.
- The system stores that sampling data in the job folder/subfolder 'Paper'.

2.1.4 Write a paper from the Audit Program and write a summary of 5 audits condition

2.1.5 The system has an Audit Program database, which users can call all files along with the content in the file.

2.1.6 The use of the Audit Program (fill in the examination results) is characterized as filling through the menu.

In the menu 'Audit Program'

- User chooses the Audit Program (issue) to be used.
- Users can fill in the results and save only some parts, including being able to edit later until the User is in Charge Job or Super User (Director). Will click End Job by allowing the system to save data in the job folder / sub folder 'paper'
- Users can fill in the results by creating or adding tables.
- Users can attach files, documents from outside.
- In each sub-story in the Audit Program, each user can click to conclude that it is not an issue or an observation.

2.1.7 When User Save, the results entered in the 'Audit Program' menu are completed.

- Allow the user to call the Audit Program report (Edition) and export to save as a Word file (paper report) and can search for many old paper reports (Dimension), such as using the search command (search) according to the paper - subject Or according to the list of Audit projects (Job Folder) or use Drop Down List and can copy (copy) messages from both the system And external sources To paste (paste) in the menu 'Audit Program' for use in other Audit projects
- Let the data processing system be a list of issues and observations of the Audit project (Job) - by each issue / observation To specify the project code as a separate field - and User can call all list reports according to the period. And the specified conditions

2.1.8 Users can prepare a summary report of 5 fields by filling in additional details that should choose the topic of the big issue, sub-issue from the Drop Down List or search for the issue name from Master Data and should have a field to fill in more details. Can link with the paper And can choose the attachment from the paper (Master Data is the name of the topic, major issues, sub-issues and categories of detected items that have the same typical text (Pattern) or may be defined as a numerical code instead of the name of the topic for the benefit of further management and analysis of data)

2.1.9 Prepare both draft and complete audit reports.

- Let the system process data from the key field in 1.1, 1.2, 1.4.3, 1.4.5 to issue (draft) reports.
- Allow the user to adjust additional information, except the name of the topic, the big issue - sub-issue And the type of the detected category Because it will be defined as Master Data
- (In case it is necessary to edit, use the director's user privileges. Internal Audit Center)

- Let the user choose the attachment from the paper or summarize the results of 5 channels. When completed, the User Click 'NEXT' for the system to send email and link to the User.
- When the right to adjust the information, click 'NEXT' for the system to send and continue to the rights of the director.
- When the rights of the director Adjust the information, click 'NEXT' to allow the system to send email and link back to the user
- When there is no further correction, give User In Charge click 'FINISH'
- The system (draft) report 1 is a file, which the user can export as a Word file.
 - (Draft) Report 2 ((draft) Report 1 + Opinion of the Audit unit)
- When User Rights In Charge Receives Opinion Information From The Audit Unit To Fill In That Information To Add In (draft) Report 1
- The system issued (draft) report 2, which the user can print and export to save as a Word file.
- If there is an additional amendment, the User In Charge can redo 1.5.8. If not, click 'COMPLETE'. Complete report
- The system issued a complete Audit report by processing from (draft) report 2 and Users can still edit additional data and links and print and export to save as a Word file.
- **Notify the follow-up as scheduled And prepare a follow-up book with Action Sheet**
 - User specifies the due date to follow up the job. Log in with the email (s) that will allow the system to send notifications (In Charge Job and General Administration Officer)
 - Each job can be followed up no more than 2 times, the same process 14 days before the due date, the system sends a notification to the specified email, along with the follow-up request and summary of the Audit report (Action Sheet) according to the template.
 - Users can edit the follow-up book. But can not solve the Action Sheet and can print and export to save as a Word file

2.1.10 Prepare an audit follow-up report.

- User enters the follow-up menu, selects the job to follow and selects the follow-up time.
- 1st Tracking
- The system displays the issue information according to the Action Sheet Job (1.6.2) and the User must not be able to edit the issue content.
- The system has a box for the user to fill in.
- Your name and date of follow
- 'Update status', which is 'can be closed' and 'cannot be closed' with accompanying reasons.

- If you select "cannot close" User and the system must repeat the process from 1.6.1 for the 2nd follow-up.
- The system processes and issues the 1st follow-up report according to the specified template.
- User Print and can export to save as a Word file.
- 2nd Tracking
- The information in the box according to 1.7.3 will be a new set of information. It is the information of "2nd update status".
- The system processes and issues the 2nd follow-up report according to the specified template.
- User Print and can export to save as a Word file.
- There is a box for User Rights of the Job. Click 'END' Job.
- Job information archive system **** No user can edit again ****

Literature Review

2.2 Overview of web application for university internal audit system

Web applications must meet the international standard “ISO 19011 Guidelines for Auditing Management Systems” because nowadays many Agencies, whether public or private or some regulatory agencies, have used this standard in their own organization's audit management and have received satisfactory results. ISO 19011 standard is currently in its 3rd edition, updated in 2018. ISO 19011:2018 is designed to be used for both Internal and External Audit according to the Deming Cycle or PDCA (Plan Do Check ACT). It consists of the following main components principle of auditing (CI.4), Managing an audit programme (CI.5), Conducting an audit (CI.6), and Competence and evaluation of auditors (CI.7).

The principles outlined in Clause 4 of ISO 19011 serve as the foundation for all auditing activities. These principles, including integrity, fair presentation, and due professional care, are extensively discussed in the literature. Researchers highlight the importance of maintaining auditor independence, ensuring confidentiality, and embracing a risk-based approach to auditing. The integration of these principles into organizational culture and practices is a key focus for ensuring the credibility and reliability of audit outcomes.

ISO 19011's guidance on managing audit programs (Clause 5) has garnered attention in the literature for its role in enhancing organizational efficiency. Scholars emphasize the significance of establishing clear audit objectives, defining criteria, and ensuring adequate resources. The literature also explores the role of leadership in creating a culture that supports the audit program, fostering continual improvement and adaptability to changes in the organizational context.

Clause 6 of ISO 19011 provides detailed guidance on the process of conducting audits. Literature in this area discusses the practical application of audit methods, emphasizing the need for systematic and evidence-based approaches. Researchers highlight the value of communication during the audit process, both within the audit team and with auditees. Case studies and practical examples in the literature

demonstrate how organizations have successfully implemented ISO 19011's recommendations in their auditing processes.

The competence and evaluation of auditors, as outlined in Clause 7, are crucial for maintaining the effectiveness of auditing activities. The literature addresses the qualifications, skills, and personal attributes required for auditors. It also explores various methods of evaluating auditor competence, including training, experience, and ongoing professional development. The role of certification bodies in ensuring auditor competence is also discussed in the literature.

In conclusion, this literature review provides a comprehensive overview of the key components of ISO 19011:2018, focusing on the Principles of Auditing, Managing an Audit Program, Conducting an Audit, and Competence and Evaluation of Auditors. The body of literature underscores the significance of these components in establishing robust auditing processes, fostering continual improvement, and ultimately contributing to the overall success and sustainability of organizations.

Related work

In recent years, the increasing digitization of processes across various industries has prompted academic researchers and practitioners to explore the integration of web applications in the field of university internal audit systems. This literature review aims to examine the current state of research and development in the realm of web-based tools for enhancing the efficiency and effectiveness of internal audit processes within the academic setting.

2.3 Integration of Web Technologies in Internal Auditing:

The convergence of web technologies with internal auditing practices has been a subject of interest for researchers and professionals. Chen et al. (2018) highlighted the benefits of web-based systems in facilitating real-time data access, collaborative audit planning, and streamlined communication among audit team members. The utilization

of web applications has shown promise in overcoming traditional limitations associated with manual and paper-based audit processes[1].

2.4 User Interface Design for Internal Audit Systems:

The importance of an intuitive and user-friendly interface in web applications for internal audit systems has been emphasized in the literature. Johnson and Brown (2019) argued that a well-designed user interface contributes significantly to the adoption and effectiveness of internal audit tools[2]. Elements such as dashboard visualization and navigation mechanisms play a crucial role in enhancing the user experience.

2.5 Security and Authentication Challenges:

The integration of web applications in the sensitive domain of internal auditing necessitates a robust security framework. Smith and Patel (2020) examined the challenges associated with user authentication and data security in web-based internal audit systems[3]. The study emphasized the need for multi-factor authentication and encryption protocols to safeguard confidential audit information.

2.6 Data Management and Analysis in Web-Based Audit Tools:

Efficient data management and analysis capabilities are crucial components of a successful web application for internal audit systems. The work of Lee and Kim (2017) explored the integration of data analytics tools within web platforms to enhance the audit process[4]. Their research demonstrated how web applications can facilitate data-driven decision-making in internal auditing.

Conclusion:

This literature review provides a snapshot of the current research landscape regarding web applications for university internal audit systems. The integration of web technologies has shown promise in improving collaboration, user experience, and data-driven decision-making in the field of internal auditing within the academic context.

CHAPTER 3

ANALYSIS AND DESIGN

This chapter consists of the system architecture overview, the process analysis and design, the database analysis and design, the I/O design, and the current progress. We separate the process analysis and design into two sections, which are the data system structure chart and the flow diagram. Database analysis and design consists of three sections which are the ERdiagram, relational schema, and data dictionary. The I/O design consists of two sections which are the Interface design and the transition diagram.

3.1 System Architecture Overview

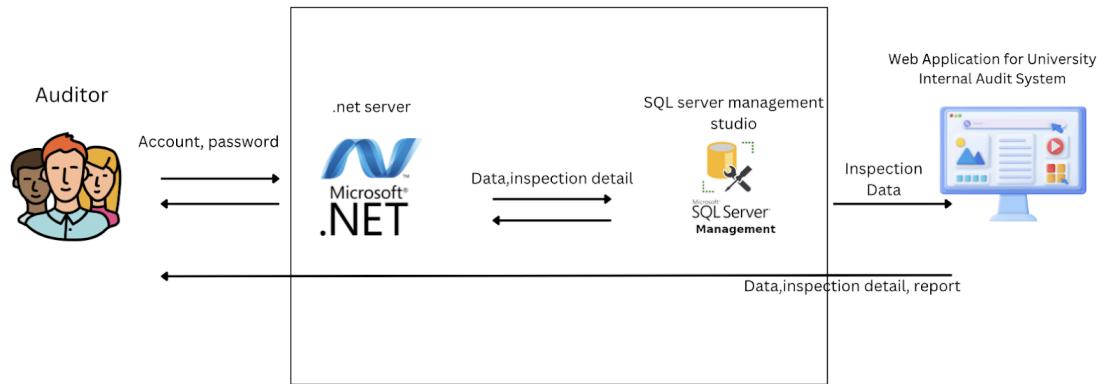

Figure 3.1: System architecture

The system architecture overview of this project primarily focuses on auditors. Our software framework utilizes .NET and Microsoft SQL Server Management for configuring, managing, and administering all database components. This setup is essential for developing a web application for the university's internal audit system.

3.2 System Structure Chart

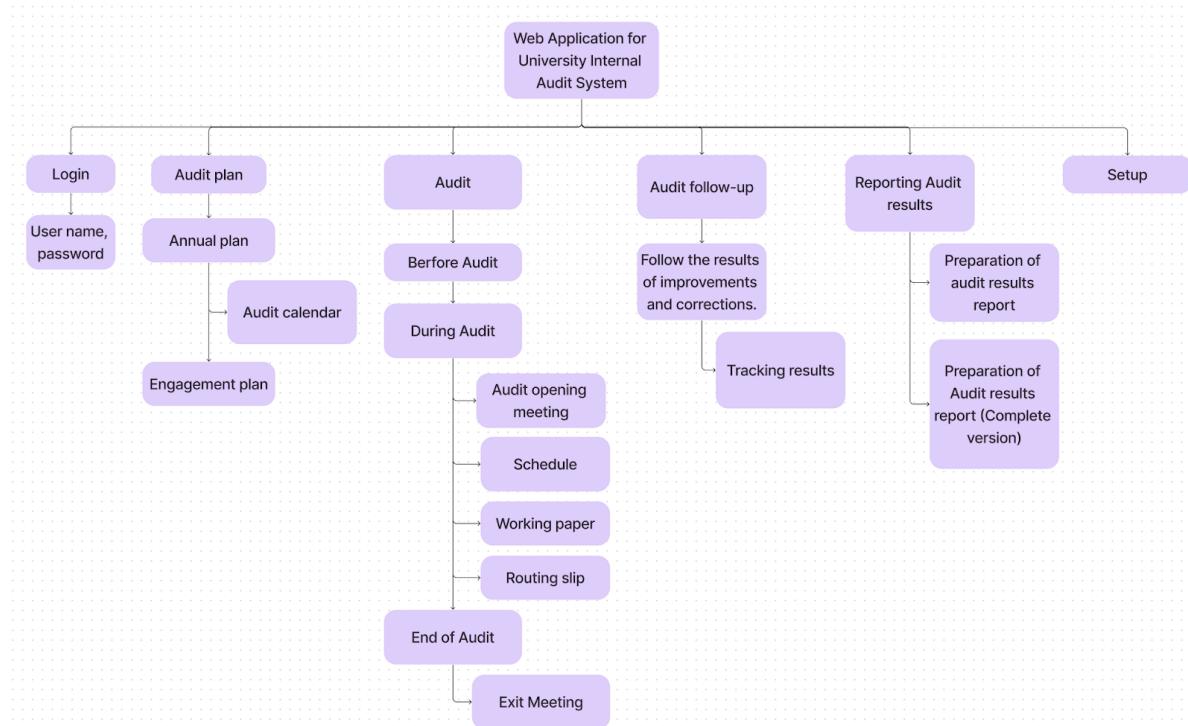

Figure 3.2: Structure chart

The structure chart of this web application for the university internal audit system is divided into six modules: login, audit plan, audit, audit follow-up, reporting audit results, and setup.

3.2.1 Login

The module is a login module.

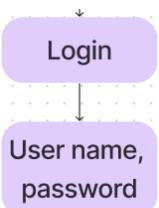

Figure 3.2.1: Login module

This login module contains the following components including username and password.

3.2.2 Audit plan

This module is an Audit plan. This module includes an annual plan and engagement plan.

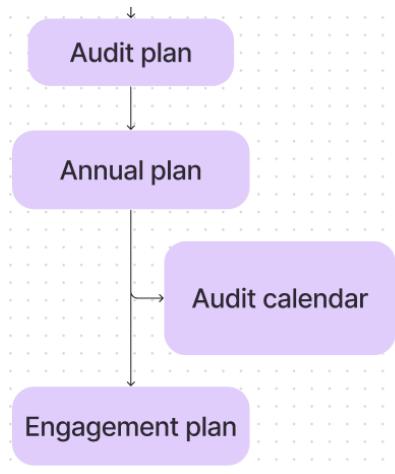

Figure 3.2.2: Audit plan module

The audit plan module contains the following components, including annual plan, which consists of a subcomponent known as audit calendar, and engagement plan.

3.2.3 Audit

The module is the Audit module. The module include the Audit procedures including before Audit, during audit, and end of audit

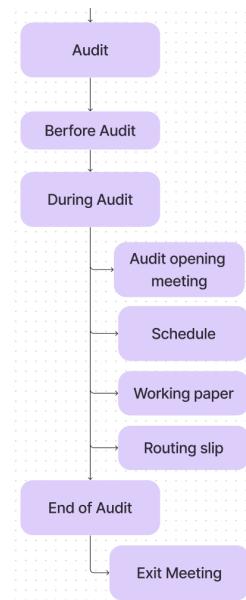

Figure 3.2.3: Audit module

The audit module contains the following components: before audit, during audit, which consists of a subcomponent known as audit opening meeting, schedule, working paper, and the last component, exit meeting.

3.2.4 Audit follow-up

The module is the audit follow-up. This module includes following the results of improvements and corrections, and tracking results.

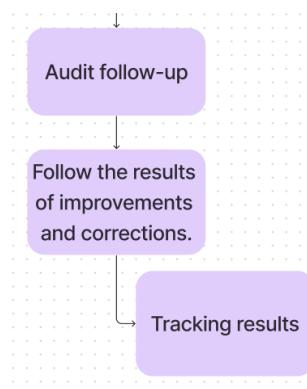

Figure 3.2.4: Audit follow-up module

The audit follow-up module contains the following components: audit follow-up, which consists of a subcomponent known as tracking results.

3.2.5 Reporting Audit results

The module is a reporting audit results. This module includes preparation of audit results report, and preparation of audit results report (complete version).

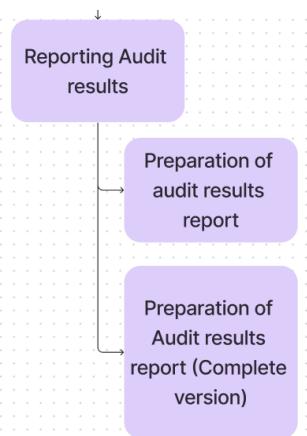

Figure 3.2.5: Reporting Audit results module

The reporting audit results module contains the following components: Preparation of audit results report, and preparation of audit results report(complete version).

3.2.6 Audit setup

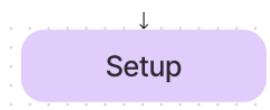

Figure 3.2.6: Audit setup

The reporting audit results module contains the following components: preparation of audit results report, and preparation of audit results report(complete version).

The detailed description of each subsystem is shown below:

Login Module

- User Login Component

Audit plan Module

- Before Audit Component
- During Audit Component
- End of Audit Component

Audit follow-up Module

- Follow the results of improvements and corrections Component

Reporting Audit result Module

- Preparation of audit results report Component
- Preparation of Audit results report (Complete version) Component

Setup Module

- Setup Component

Process Analysis and Design

3.3 Data Flow Diagram

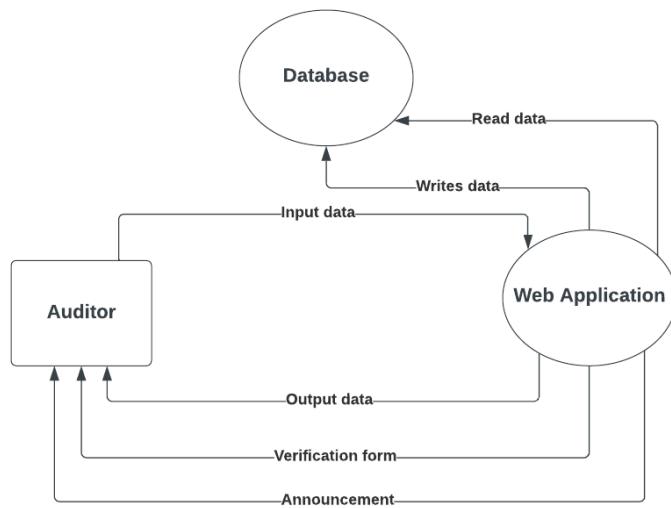

Figure 3.3: Data flow diagram Lv0

This level 0 data flow diagram shows the flow of the web application system for auditors. Initially, auditors send their login information to the system, and the system will retrieve their data from the database for authentication. Once logged in, auditors can input, edit, and delete audit data. The system updates the database with the auditors' inputs.

Following the audit process, auditors receive outputs from the system, which retrieves data from the database. Auditors then receive verification forms and announcements from the system based on the processed data.

3.4 Data Flow Diagram Level.1

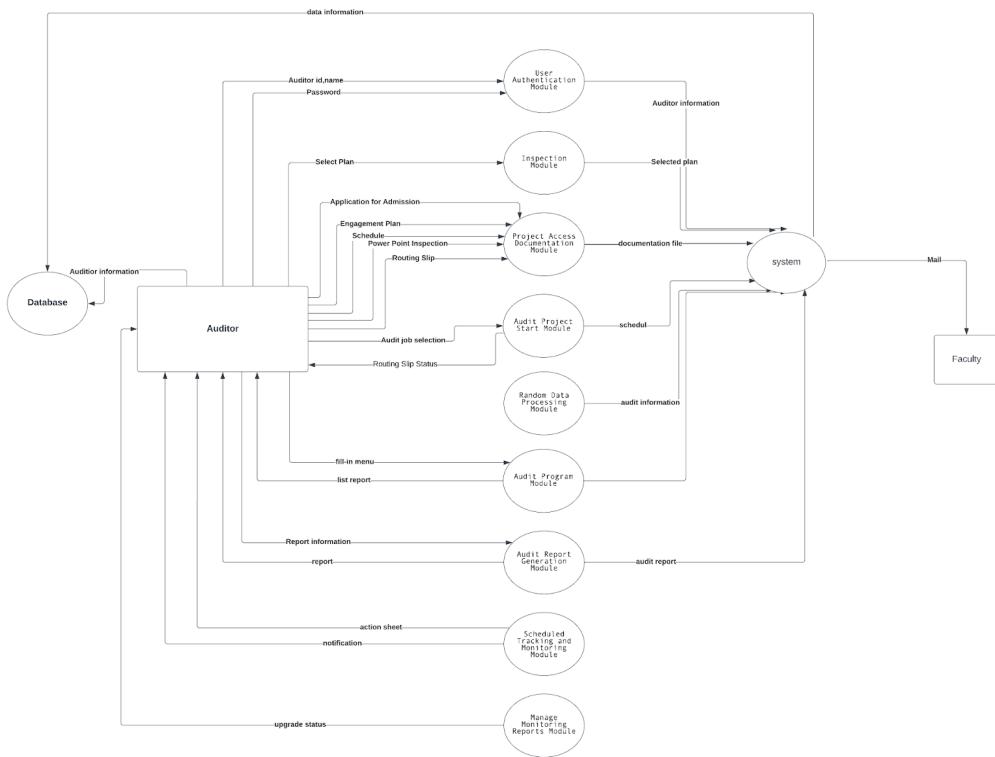

Figure 3.4: Data flow diagram Lv1

This level 1 data flow diagram shows the flow of the web application system for auditors, containing the following information.

Login

This login will request auditor information including username and password will be sent to the system and then stored into the database.

Audit Plan

The audit plan will request auditor information, including annual plan data, and engagement plan data, then it will be sent to the system and then stored into the database.

Audit

The audit will request auditor information including before audit data, during audit data ,then it will be sent to the system and then stored into the database.

Audit follow-up

The audit follow-up will request auditor information including before audit audit follow-up data, then it will be sent to the system and then stored into the database.

Audit Report

The reporting audit results will request auditor information including department name, the topic or the subject of the audit, the date, and the status of each faculty ,then it will be sent to the system and then stored into the database.

3.5 Use Case Diagram

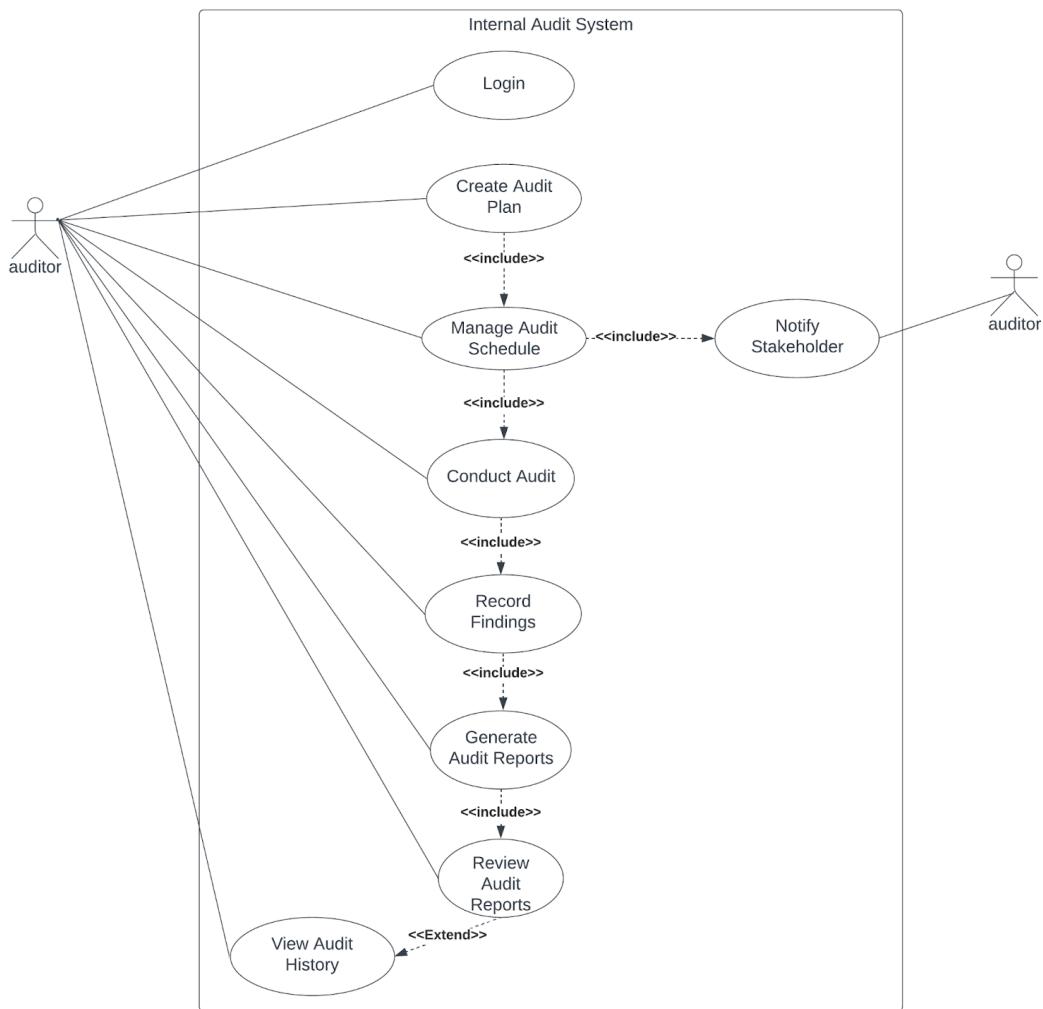

Figure 3.5: Use Case Diagram

This use case diagram for the web application system designed for auditors at Mahidol University encompasses several key functionalities. Auditors can log in by inputting their information, which are validated and stored in the system's database. They can then create, update, or review audit plans, including engagement plan details, which are saved for future reference. During audits, auditors input data before and during the audit process, which is transmitted to the system and stored securely. Moreover, auditors can conduct follow-up reports by entering data into the system. Finally, auditors can receive audit reports by specifying department names, audit topics, dates, and faculty statuses. This use case diagram highlights the system's role in facilitating

efficient auditing processes while ensuring data integrity and compliance with auditing standards

Data Stores

This section describes the data stores that exist in the data flow diagram and consists of the Data Store Name, Description, Inbound Data, and Outbound Data.

Table 3.6: List of all Data Stores

No.	Data Store Name	Type	Description
1	Board_id	int	Unique identifier for a board.
2	BoardName	nvarchar	Name of the Board.
3	Inspection_id	int	Unique identifier for inspection.
4	InspectionName	nvarchar	Name of the inspection.
5	InspectionDateStart	datetime2	Start date of inspection.
6	InspectionDateEnd	datetime2	End date of inspection.
7	InspectionObjective	nvarchar	Objective of inspection.
8	Status	nvarchar	Status of the inspection.
9	Schedule_id	int	Unique identifier for a schedule.
10	ScheduleDetail	nvarchar	Detail of the schedule that has an inspection.
11	ScheduleDoc	nvarchar	The name of the document for the inspection.
12	ScheduleDate	nvarchar	The date that has been inspected.
13	ScheduleTime	nvarchar	The time that has the inspection.
14	RoutingSlip_id	int	Unique identifier for RoutingSlip.
15	Detail	nvarchar	The detail in the routing slip.
16	InspectionPlan	nvarchar	The Plan for the day that has an inspection.
17	WorkPlan	nvarchar	The work plan for the inspection day.
18	Comment	nvarchar	The comment for the auditing.
19	User_id	int	Unique identifier for user.

No.	Data Store Name	Type	Description
20	Username	nvarchar	The username for logging in to the website.
21	Password	nvarchar	The password for logging in to the website.
22	Name	nvarchar	The name of the user.
23	WorkCalendar_id	int	Unique identifier for work calendar.
24	Project	nvarchar	The Project is to be shown on the work calendar.
25	ProcessingTime	nvarchar	The processing time of the project.
26	Quantity	nvarchar	The quantity of the coordinator of the project.
27	Coordinator	nvarchar	The name of the coordinator of the project.
28	Issue	nvarchar	The project is an issue.
29	WorkPaper_id	int	Unique identifier of the work paper.
30	Activity	nvarchar	The control activity of the project.
31	WorkPaperProcedure	nvarchar	The procedure for auditing.
32	InspectionResult	nvarchar	The result of the audit.
33	Issue	nvarchar	The result of the audit is an issue.
34	Not_issue	nvarchar	The result of the audit is not an issue.
35	Remark	nvarchar	The remark for the auditing.
36	Engagement_id	int	Unique identifier for engagement plan.
37	EngagementProcedure	nvarchar	The procedure of the engagement plan.
38	Inspector_Name	nvarchar	The inspector's name.
39	Working_Hour	nvarchar	The working hours of auditing.
40	WP_Code	nvarchar	The W/P code.

3.6 Database Analysis and Design

ER-Diagram

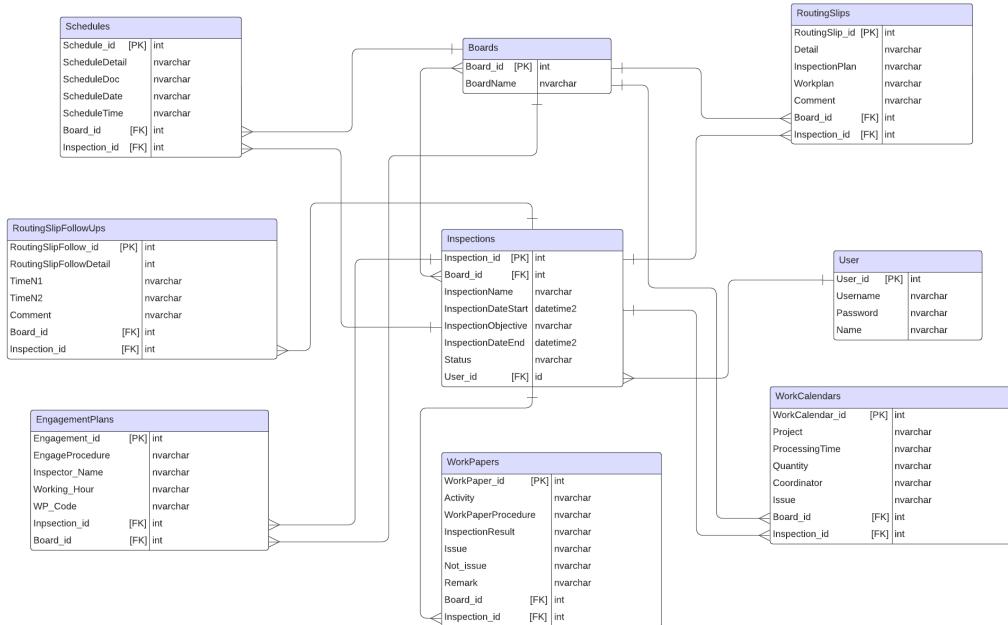

Figure 3.6: ER-Diagram

The figure above shows the er-diagram system consists of nine entities: schedule, routing slip, routing slip follow-up, boards, user, work calendars, engagement plans, working paper, and inspection.

The user entity has a user_id as the PK, which means each user cannot have the same username.

The schedule entity has a schedule_id as the PK, which means each schedule cannot have the same schedule_id.

The routing slip entity used routingslip_id as the PK, which means that every routing slip cannot have the same routingslip_id.

The routing slip follow-up entity used routingslipfollowup_id as the PK, which means that every routing slip follow-up cannot have the same routingslip_id.

The boards entity used boards_id as the PK, which means that every boards cannot have the same boards_id.

The work calendars entity used workcalendars_id as the PK, which means that every work calendars cannot have the same workcalendars_id.

The engagement plans entity used engagementplans_id as the PK, which means that every engagement plans cannot have the same engagementplans_id.

The working paper entity used workingpaper_id as the PK, which means that every working paper cannot have the same workingpaper_id.

The inspection entity used inspection_id as the PK, which means that every inspection cannot have the same inspection_id.

the end of the stage. The following details will be provided regarding each entity's attributes:

schedule entity:

- schedule_id (PK) : The id to identify the schedule.
- scheduleDetail : Used to indicate the detail of the schedule table.
- scheduleDoc : Used to specify the name of the required document in the schedule.
- scheduleDate : Used to specify the schedule date.
- scheduleTime : Used to specify the schedule time.
- Board_id(FK) : Used to indicate which board is for this schedule.
- inspection_id(FK) : Used to indicate which inspection subjects are for this schedule table.

routing slip entity:

- routingslip_id (PK): The number to identify the routing slip.
- Detail: Used to indicate the detail of routing slip.
- InspectionPlan: Used to indicate the inspection plan detail of routing slip.
- Workplan : Used to indicate the work plan detail of routing slip.
- Comment : Used to indicate the feedback of routing slip.

routing slip follow-up entity:

- routingslipfollowup_id (PK) : The number to identify the routing slip follow-up.
- routingslipFollowDetail: Used to indicate the detail of routing slip follow-up.
- TimeN1: Used to indicate the detail of the first time of routing slip follow-up.

- TimeN2: Used to indicate the detail of the second time of routing slip follow-up.
- Comment: Used to indicate the detail of the feedback of routing slip follow-up.
- Board_id(FK) : Used to indicate which board are for this routing slip follow-up
- inspection_id(FK) : Used to indicate which inspection subjects are for this routing slip follow-up table.

boards entity:

- boards_id (PK): The number to identify the boards.
- BoardName: the name of the board added to the table.

user entity:

- user_id (PK): The number to identify the users.
- Username: the username of the user who registered this account.
- Password: the password of the user who registered this account.
- Name: the account name of the user who registered this account.

work calendars entity:

- workcalendars_id (PK): The number to identify the work calendars.
- Project: Used to specify the project name of the work calendars.
- ProcessingTime: Used to specify the processing time of work calendars.
- Quantity: Used to specify the quantity that is required.
- Coordinator: Used to specify the auditor who's responsible for this matter.
- Issue: Used to indicate the work calendar's objective.
- Board_id(FK) : Used to indicate which boards are for this work calendar.
- inspection_id(FK) : Used to indicate which inspection subjects are for this work calendars table

engagement plans entity:

- engagementplans_id (PK): The number to identify the engagement plan.
- EngageProcedure: Used to store engagement procedure data.
- Inspector_Name: Used to store the inspector's name.
- Working_Hour: Used to store the number of hours of the procedures.
- WP_Code: Used to store wp code of the procedures.
- Board_id(FK) : Used to indicate which board are for this engagement plans

- inspection_id(FK) : Used to indicate which inspection subjects are for this engagement plans table.

working paper entity:

- workingpaper_id (PK): The number to identify the working paper.
- Activity: Used to indicate the working paper activity.
- WorkPaperProcedure: Used to specify the name of the required document in the working paper.
- inspectionResult: Used to specify the inspection result.
- issue: Used to specify the details of issues that need to be resolved.
- Not_issue: Used to specify the details of issues that no need to be resolved.
- Remark: Used to specify the remark topic of the working paper.
- Board_id(FK) : Used to indicate which boards are for this working paper entity.
- inspection_id(FK) : Used to indicate which inspection subjects are for this working paper table.

inspection entity:

- inspection_id (PK): The number to identifies the inspection
- Board_id(FK) : Used to indicate which boards are for this inspection entity.
- User_id(FK) : Used to indicate which inspection subjects are for this inspection table.
- inspectionName: Used to indicate the inspection subject.
- inspectionDatestart: Used to indicate the inspection date start.
- inspectionObjective: Used to indicate the inspection objective.
- inspectionDateEnd: Used to indicate the inspection date end.
- Status: Used to indicate the inspection status.

3.7 Relational Schema

This section describes the attributes of the tables in the database. The attribute notation is shown below.

- **Attributes** – which are bold and underlined are the Primary Keys
- *Attributes* – which are Italic are the Foreign Keys
- **Attributes** – which are bold, italic, and underlined are both Primary Keys and Foreign Keys

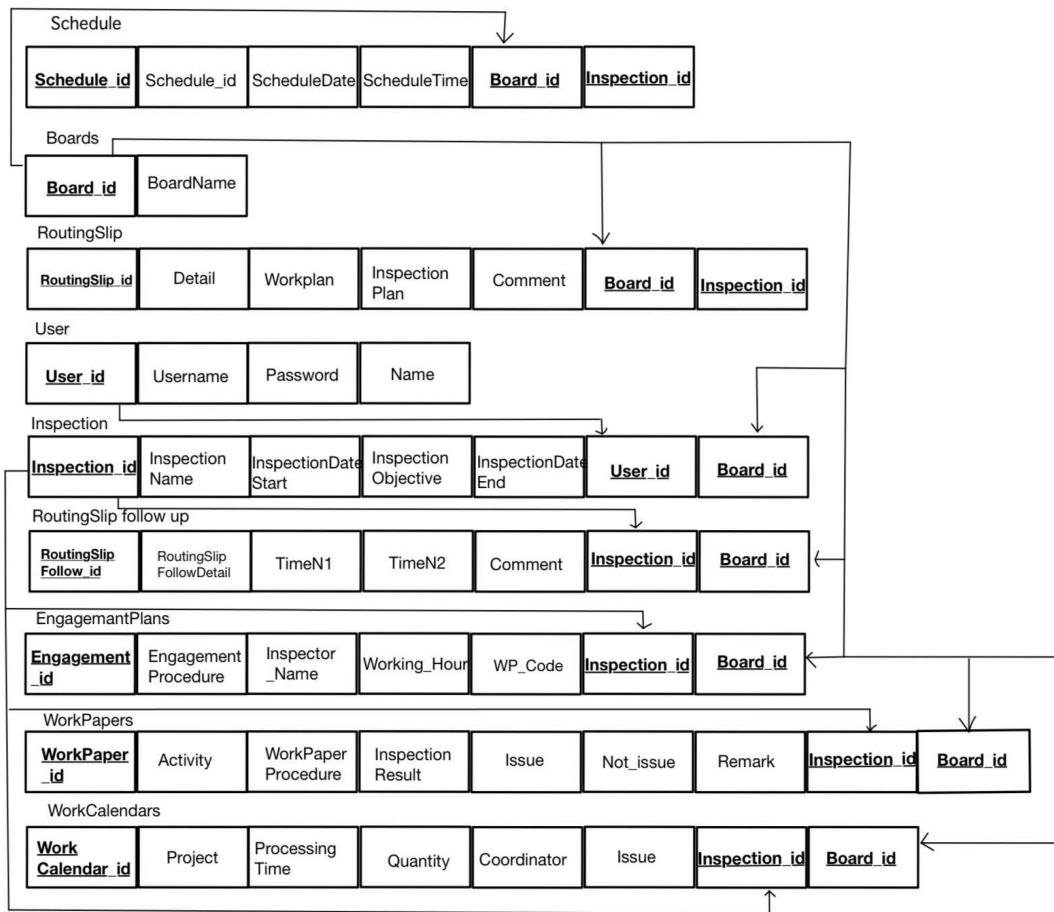

Figure 3.7: Relational schema

The relational schema for Mahidol University's web audit application helps the auditor with the auditing process through web application. The Schedule Entity captures schedule details, while the Routing Slip and Routing Slip Follow-up Entities manage routing slips and follow-ups. The Boards Entity stores board information, and the User Entity manages user accounts. The Work Calendars Entity tracks project

details, and the Engagement Plans Entity details engagement procedures. The Working Paper Entity captures activities and results, and the Inspection Entity manages inspection details. This schema ensures data integrity, enhancing audit efficiency, accuracy, and compliance.

Tables in this system can be divided into 3 groups as follows:

- Master File Table
- Base File Table
- Transaction File Table

Table 3.7: List of all Tables in Our System Database

Table#	Table Name	Table Type	Description
1.	User	Master File	This table stores the user information
2.	Audit	Base File	This table stores the Audit plan of the Audit Web Application
3.	EngagementPlans	Transaction File	This table stores the information of the procedure, auditor, and Time of Engagement Plan.
4.	Boards	Transaction File	This table stores the information of the Board.
5.	Schedules	Transaction File	This table stores the information on the schedule for having an audit.
6.	RoutingSlips	Transaction File	This table stores the information of the detailed plan for the audit.
7.	WorkingPapers	Transaction File	This table stores the auditor, comment, remark of the audit
8.	RoutingSlipFollowUp	Transaction File	This table stores the information on the follow-up of the audit schedule.

Table#	Table Name	Table Type	Description
9.	WorkCalendars	Transaction File	This table stores the information of the Calendar to save the audit calendar data.

Interface Design

3.8 Login page

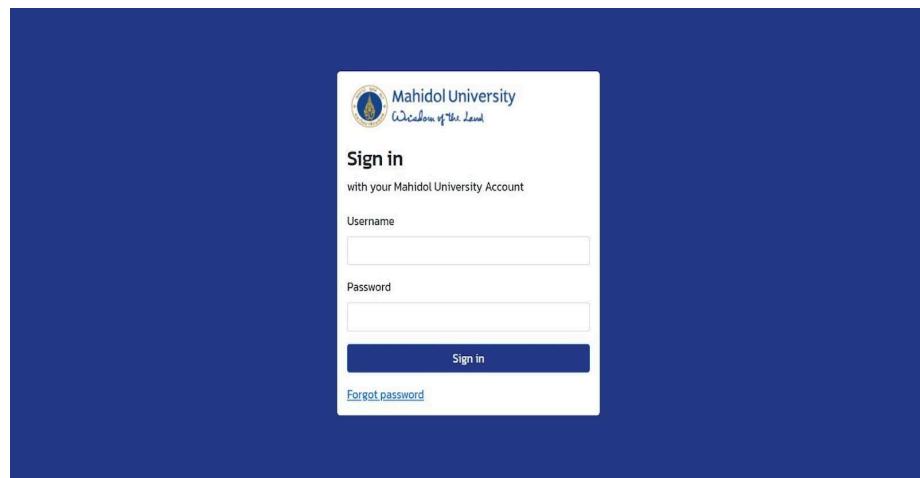

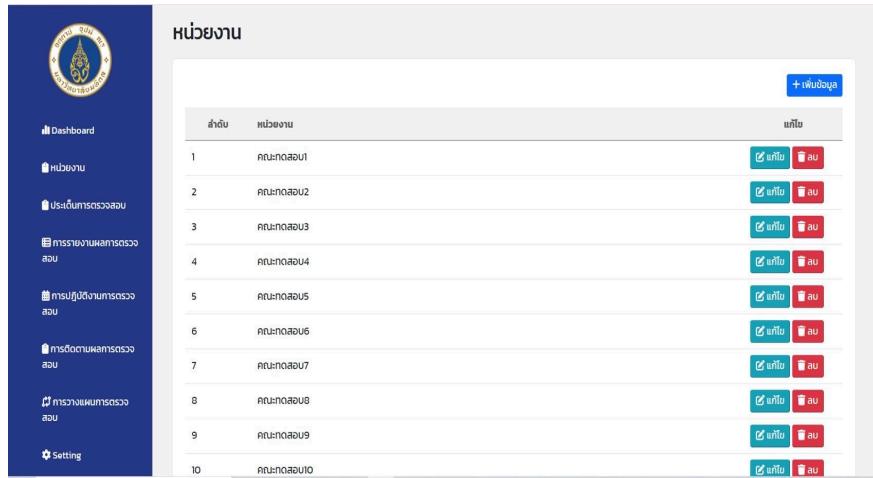

Figure 3.8 :Login page

This page allows auditors to log in by entering their username and password. By providing their credentials, auditors can securely access the system to perform their auditing tasks. The login process ensures that only authorized personnel can gain entry, thereby maintaining the security and integrity of the financial records and audit data.

3.8.1 Setting page

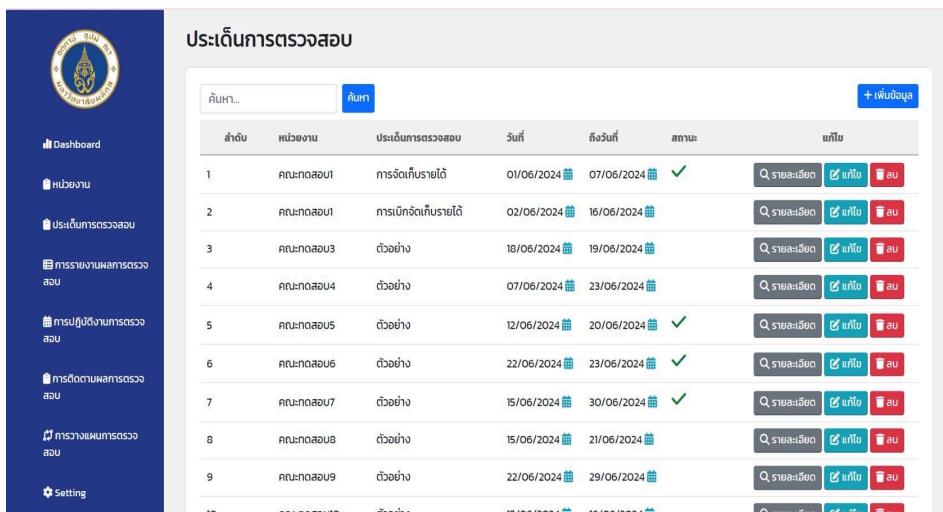

The screenshot shows a table titled "หน่วยงาน" (Units) with 10 rows. Each row contains a number, the name of the unit, and two buttons: "แก้ไข" (Edit) and "ลบ" (Delete). The units listed are: 1. คณะกศนฯ, 2. คณะกศบฯ, 3. คณะกศชฯ, 4. คณะกศดฯ, 5. คณะกศสฯ, 6. คณะกศอฯ, 7. คณะกศทฯ, 8. คณะกศมฯ, 9. คณะกศวฯ, and 10. คณะกศกฯ.

ลำดับ	หน่วยงาน	แก้ไข	ลบ
1	คณะกศนฯ		
2	คณะกศบฯ		
3	คณะกศชฯ		
4	คณะกศดฯ		
5	คณะกศสฯ		
6	คณะกศอฯ		
7	คณะกศทฯ		
8	คณะกศมฯ		
9	คณะกศวฯ		
10	คณะกศกฯ		

Figure 3.8.1 : Setting page

This settings page provides auditors with the functionality to manage the various faculties and departments that will undergo auditing. Auditors have the ability to add new faculties or departments, edit existing ones, and delete those that are no longer relevant. This feature ensures that the list of entities to be audited is always up-to-date and accurately reflects the current auditing requirements.

3.8.2 Audit management page

The screenshot shows a table titled "ประเด็นการตรวจสอบ" (Audit Topics) with 10 rows. Each row contains information such as the topic name, description, start date, end date, status, and two buttons: "รายละเอียด" (Details) and "แก้ไข" (Edit). The topics listed are: 1. การจัดเก็บรายได้, 2. การเบิกจัดเก็บรายได้, 3. ตัวอย่าง, 4. ตัวอย่าง, 5. ตัวอย่าง, 6. ตัวอย่าง, 7. ตัวอย่าง, 8. ตัวอย่าง, 9. ตัวอย่าง, and 10. ตัวอย่าง.

ลำดับ	ประเด็นการตรวจสอบ	ประเภท	วันที่	สิ้นวันที่	สถานะ	แก้ไข
1	คณะกศนฯ	การจัดเก็บรายได้	01/06/2024	07/06/2024		
2	คณะกศบฯ	การเบิกจัดเก็บรายได้	02/06/2024	16/06/2024		
3	คณะกศชฯ	ตัวอย่าง	16/06/2024	19/06/2024		
4	คณะกศดฯ	ตัวอย่าง	07/06/2024	23/06/2024		
5	คณะกศสฯ	ตัวอย่าง	12/06/2024	20/06/2024		
6	คณะกศอฯ	ตัวอย่าง	22/06/2024	23/06/2024		
7	คณะกศทฯ	ตัวอย่าง	15/06/2024	30/06/2024		
8	คณะกศมฯ	ตัวอย่าง	15/06/2024	21/06/2024		
9	คณะกศวฯ	ตัวอย่าง	22/06/2024	29/06/2024		
10	คณะกศกฯ	ตัวอย่าง	15/06/2024	16/06/2024		

Figure 3.8.2: Audit management page

This audit management page focuses on the topic or the subject that the auditor will be auditing in various faculty. This page collects information such as the faculty

of department name, the topic or the subject of the audit, the date, and the status of each faculty. Moreover, Auditors have the ability to add new faculties or departments, edit existing ones, and delete those that are no longer relevant in the audit detail section as shown in figure 3.9.3 below.

3.8.3 Add audit detail page

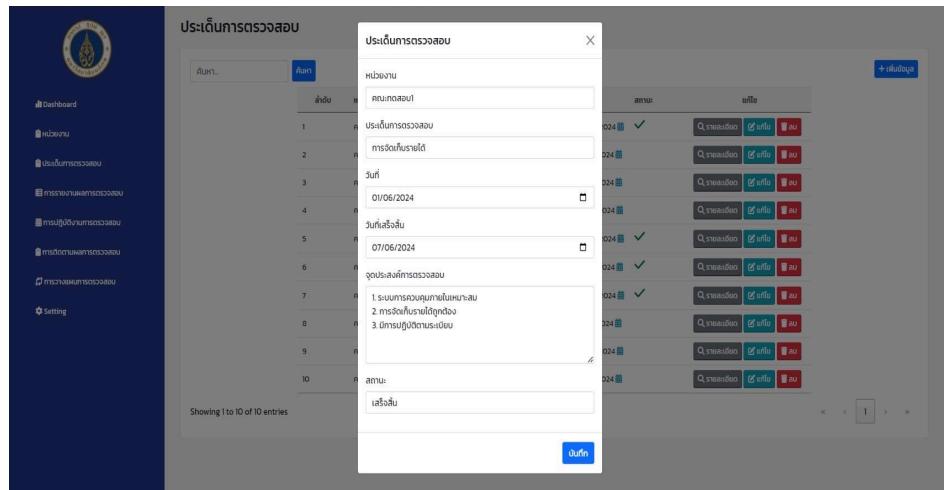

Figure 3.8.3 : Add audit detail page

3.8.4 Routing slip

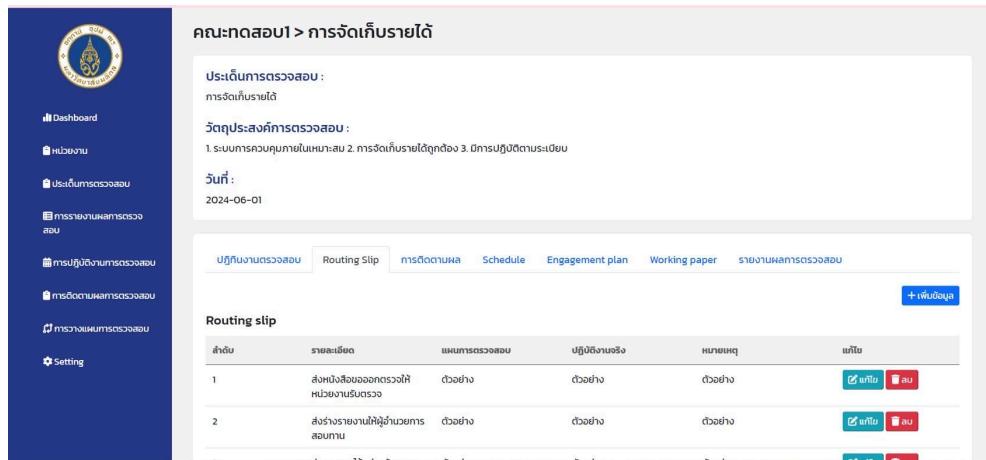

Figure 3.8.4 : Routing slip page

This routing slip page focuses on the details of the audit and monitors the progress of the audit. Users are enabled to input their routing slip data into the table, with the ability to add, edit, and delete entries as needed.

3.8.5 Routing slip follow-up

The screenshot shows a web-based audit management system. On the left is a dark blue sidebar menu with icons and labels for Dashboard, Audit Plan, Audit Log, Audit Report Generation, Audit Follow-up, and Settings. The main content area has a light gray header "ຄະນະກົດສອບ1 > ການຈັດເກີບຮາຍໄດ້". Below it is a section for "ປະເດີນການຕຽບສອບ" (Audit Findings) with a note about reporting findings. A "ວັດຖຸປະໂຫຍດ" (Audit Scope) section lists three items: 1. ຮັບການກວດທຸກພາບໃໝ່ເໜີຍ, 2. ການຮັດທີ່ບໍາຍໄດ້ຖຸກຕົ້ນ, 3. ມິກາຣປົງປັດຕານຮະເມືອນ. A date field shows "ວັນທີ: 2024-06-01". Below these are tabs for "ປົງກິນຈານຕຽບສອບ", "Routing Slip" (which is selected), "ການດົດຕານພັດ", "Schedule", "Engagement plan", "Working paper", and "ຮາຍການກວດສອບ". A "ເພີ້ມຂໍ້ມູນ" (Add New) button is at the top right. The "ການດົດຕານພັດ" section contains a table with three rows:

ລຳດັບ	ລືດຕານພັດ	ຄື່ອງທີ່1	ຄື່ອງທີ່2	ໝາຍເມັດ	ແກ້ໄຂ
1	ວັນທີ ອນ ບົດກາງນໍ້າໄວ້ປີເຈັງເຄີຍຜູ້ຮັວງສອບເກີບ ຖ້າເໜີຍ ດົດຕານພັດ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	
2	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	
3	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	

Figure 3.8.5 : Routing slip follow-up page

This routing slip follow-up page focuses on tracking the details and progress of the audit. Users can input their routing slip data into the table and have the ability to add, edit, and delete entries as needed.

3.8.6 Engagement plan

The screenshot shows the same audit management system. The main content area has a light gray header "ຄະນະກົດສອບ1 > ການຈັດເກີບຮາຍໄດ້". Below it is a section for "ປະເດີນການຕຽບສອບ" (Audit Findings) with a note about reporting findings. A "ວັດຖຸປະໂຫຍດ" (Audit Scope) section lists three items: 1. ຮັບການກວດທຸກພາບໃໝ່ເໜີຍ, 2. ການຮັດທີ່ບໍາຍໄດ້ຖຸກຕົ້ນ, 3. ມິກາຣປົງປັດຕານຮະເມືອນ. A date field shows "ວັນທີ: 2024-06-01". Below these are tabs for "ປົງກິນຈານຕຽບສອບ", "Routing Slip", "ການດົດຕານພັດ", "Schedule", "Engagement plan" (which is selected), "Working paper", and "ຮາຍການກວດສອບ". A "ເພີ້ມຂໍ້ມູນ" (Add New) button is at the top right. The "Engagement plan" section contains a table with three rows:

ລຳດັບ	ວິຊາການກວດສອບ	ຜູ້ຮັວງສອບ	ສ່ວນວິທີປົງປັດຕານ	ສັກ W/P	ແກ້ໄຂ
1	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	
2	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	
3	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	ດ້ວຍຢ່າງ	

Figure 3.8.6 : Audit detail engagement plan page

This engagement plan page focuses on details of the list of auditors and the methods of audit inspection. Users can input their engagement plan data into the table, with the ability to add, edit, and delete entries as needed.

3.8.7 Schedule

The screenshot shows a web-based application interface for scheduling inspection tasks. The left sidebar contains navigation links such as Dashboard, Home, Basic Information, Inspection Management, Audit Management, Working Paper, and Settings. The main content area has a header 'ຄະນະກົດສອບ1 > ການຈັດເກີບຮາຍໄດ້' (Schedule Audit). It displays details about the audit: 'ປະເທດການຕຽບສອບ : ການຈັດເກີບຮາຍໄດ້', 'ວັດຖຸປະສົງການຕຽບສອບ : 1. ຮະບັບການຈັດກຸມການໃໝ່ເນັ້ນຂາຍ 2. ການຈັດເກີບຮາຍໄດ້ຖຸກຕົ້ນ 3. ມິດຕະກິບປີຕານຮະເບີນ', and 'ວັນທີ : 2024-06-01'. Below this is a navigation bar with tabs: ບົກລົງການຕຽບສອບ, Routing Slip, ການຕືດຕາມ, Schedule, Engagement plan, Working paper, and ຮາຍງານການຕຽບສອບ. The 'Schedule' tab is selected, showing a table with three rows:

ລຳດັບ	ຮາຍການທີ່ຈັດເກີບຮາຍ	ເພື່ອການໃຫ້ຈັດເກີບຮາຍ	ວັນທີ	ເວລາ	ແກ້ໄຂ
1	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	
2	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	
3	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	

Figure 3.8.7 : Schedule page

This schedule page focuses on the operation details and the list of documents required for audit inspection. Users can input their schedule data into the table, with the ability to add, edit, and delete entries as needed.

3.8.8 Working paper

The screenshot shows a web-based application interface for managing working papers. The left sidebar contains navigation links such as Dashboard, Home, Basic Information, Inspection Management, Audit Management, Working Paper, and Settings. The main content area has a header 'ຄະນະກົດສອບ1 > ການຈັດເກີບຮາຍໄດ້' (Schedule Audit). It displays details about the audit: 'ປະເທດການຕຽບສອບ : ການຈັດເກີບຮາຍໄດ້', 'ວັດຖຸປະສົງການຕຽບສອບ : 1. ຮະບັບການຈັດກຸມການໃໝ່ເນັ້ນຂາຍ 2. ການຈັດເກີບຮາຍໄດ້ຖຸກຕົ້ນ 3. ມິດຕະກິບປີຕານຮະເບີນ', and 'ວັນທີ : 2024-06-01'. Below this is a navigation bar with tabs: ບົກລົງການຕຽບສອບ, Routing Slip, ການຕືດຕາມ, Schedule, Engagement plan, Working paper, and ຮາຍງານການຕຽບສອບ. The 'Working paper' tab is selected, showing a table with three rows:

ລຳດັບ	ສິດການກົດສອບ	ຮັບການຕຽບສອບ	ໜາກການຕຽບສອບ	ເປັນປະເທິດ	ໄມ້ປະເທິດ	ຂັ້ນສິ້ນສົດ	ແກ້ໄຂ
1	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ		
2	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ		
3	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ	ດັວຍຢ່າງ		

Figure 3.8.8 : Working paper page

The working paper page focuses on documenting inspection results, indicating whether issues are identified or not. Users can input their working paper data into the table, with the ability to add, edit, and delete entries as necessary.

3.8.9 Audit report

รายงานผลการตรวจสอบ
คุณผู้ตรวจสอบภายใน มหาวิทยาลัยหอดส์
วันที่ : 2024-06-01
ตามแผนการตรวจสอบภายใน ซึ่งได้รับการอนุมัติจากคณะกรรมการตรวจสอบการบริหารงานประจำมหาวิทยาลัยและอธิการบดีแล้วนั้น คุณผู้ตรวจสอบภายในได้เข้าตรวจสอบ

ประเด็นการตรวจสอบ :
การจัดเก็บรายได้
การดำเนินงานตรวจสอบได้ถูกดำเนินการอย่างมีประสิทธิภาพและมีความโปร่งใส ไม่มีข้อบกพร่องใดๆ ในการดำเนินการตรวจสอบ ดังนี้

วัตถุประสงค์การตรวจสอบ :
1. สอบสวนความชอบด้วยอิทธิพลทางการเมือง 2. การจัดเก็บรายได้ถูกต้อง 3. มีการปฏิบัติตามระเบียบ
การวิเคราะห์ เปรียบเทียบ สอบถาม ลังกวดารณ และสืบหาหนังสือที่มีส่วนเกี่ยวข้องสรุปผลการตรวจสอบสำคัญ สำหรับผู้บริหาร

Figure 3.8.9 : Audit detail Report page

The Audit report page generates a comprehensive report for auditors based on department name, audit topic, and audit date configured in the audit management page.

3.9 Transition Diagram

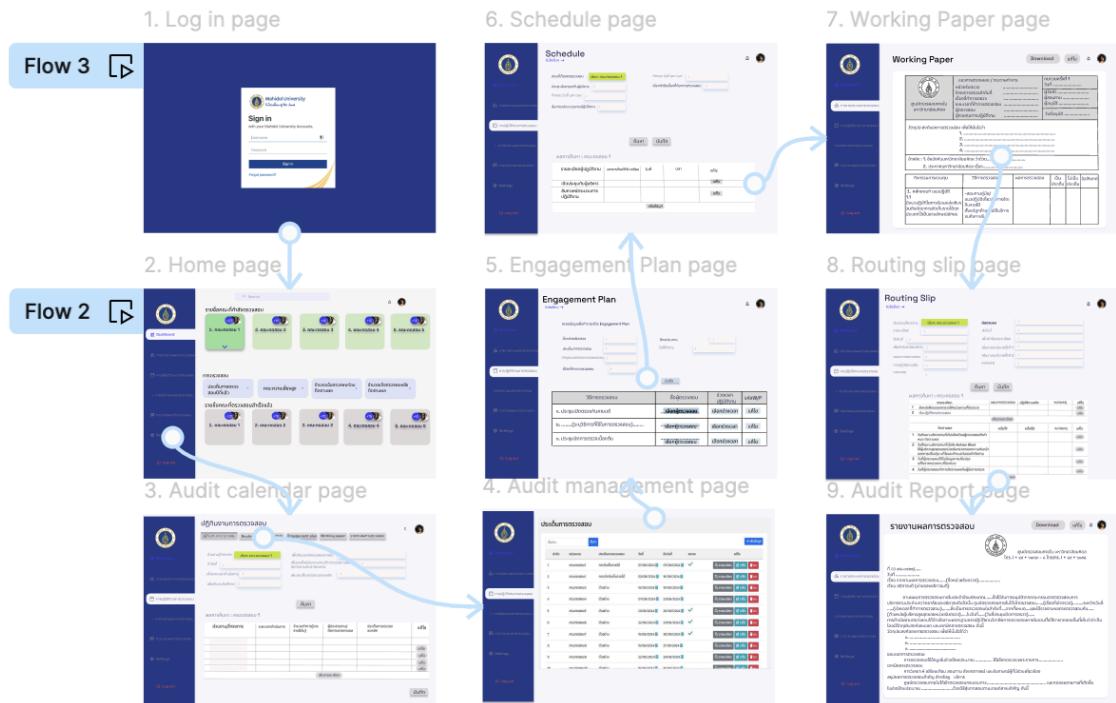

Figure 3.9 : Audit web application transition diagram

This transition diagram shows the sequence of the process of how to audit. The first thing the auditor needs to log in, and then they will see the home page. Secondly, auditors have to set an audit calendar. To do that, the auditor can click on the navigation bar to access the audit calendar page. Thirdly, the auditor then chooses the objective of the audit on the audit management page. Next, after setting the objective, the auditor can use the engagement plan page to store and edit their data in the table. Next, the auditor can set their schedule on the schedule page. After that, the auditor can input their data on the working paper page. Next, the auditor can use the routing slip page to check the progress of the audit. Lastly, auditors can see their audit report on the audit report page.

CHAPTER 4

IMPLEMENTATION

In this section, we provide the details of the specifications of the computer of our web server (Table 4.1), editor (Table 4.2), system environment (Table 4.3), framework (Table 4.4), and database management system (Table 4.5). For more information will be discussed in the next section below.

4.1 Hardware and System Environment

- Programming and Scripting Tools

- SQL server management studio

This is a tool used in Database Engine to create tables to store data.

There will be SQL Server Integration Service (SSIS) for preparing data, SQL Server Analysis Service (SSAS) for making Data Models, SQL Server Reporting Service (SSRS) for doing. Summary report including accessing, configuring, managing, administering, and developing

- .Net framework 4.8.1

This is a platform used to develop software by connecting databases to computer network connections to make web applications.

- Visual studio 2022

This is an IDE (Integrated Development Environment) program used to develop software and web applications.

- Bootstrap

It is a tool used for designing websites to be suitable for devices by using HTML, CSS, JS to develop tools for designing website pages (Front-end component library).

- Components

- Browser
- Chrome

Chrome is a website used to display the appearance of web applications.

- Equipment

- Notebook

Table 4.1: Specifications of the computer of our web server

Table Name	Description
CPU	4 Core
RAM	8 GB
Storage	1 TB
Operating System	Window 10

Table 4.2: Editor

Software Name	Version	Purpose
Visual Studio 2022	17.9.6	To perform coding

Table 4.3: Database Management System

Software Name	Version	Purpose
SQL Server Management Studio	19.3	Used to store data and run the database service on the web server.

Software Name	Version	Purpose
C#	11	Using a programming language to write frontend and backend.

Table 4.5: Framework

Library name	Version	Purpose
.Net framework	4.8.1	This feature enables software developers to create applications in one programming language, ensuring compatibility with code written in other languages.
Bootstrap 5	5.3	Making web development faster and easier.

In this section, we use the architecture design for the standard .net framework(Table 4.1) to discuss our website implementation. For more information about architecture is shown in the list below.

4.2 Website Implementation

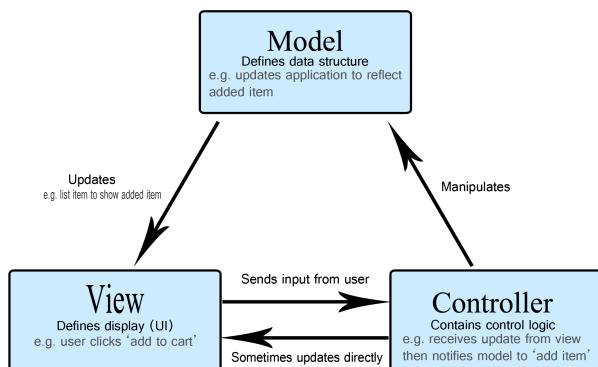

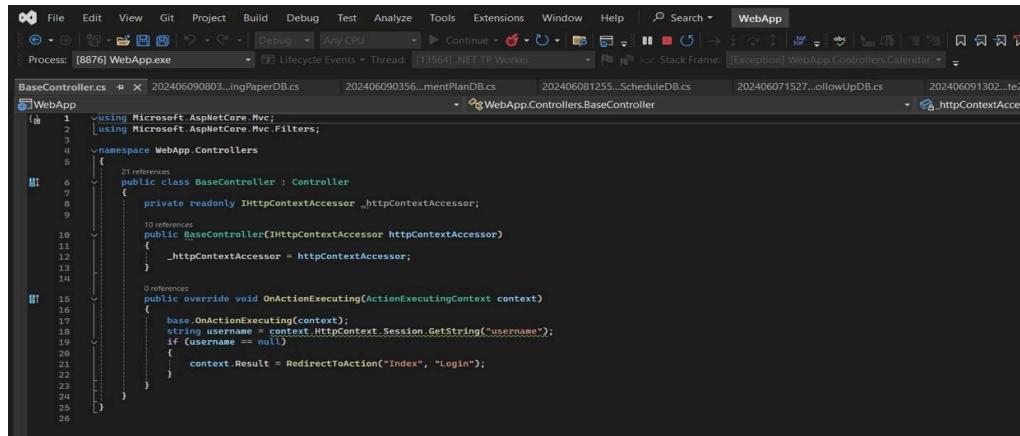

Figure 4.2: Architecture Design for standard .net framework (MVC)

4.3 Controller

A controller is responsible for controlling the way that a user interacts with an MVC application. A controller contains the flow control logic for an ASP.NET MVC application. A controller determines what response to send back to a user when a user makes a browser request. Figure 4.3.1, Figure 4.3.2, Figure 4.3.3, Figure 4.3.4, Figure 4.3.5, Figure 4.3.6, Figure 4.3.7, Figure 4.3.8, Figure 4.3.9, Figure 4.3.10, Figure 4.3.11, Figure 4.3.12, Figure 4.3.13 represent a code of controller for each page of web application.

Base controller

```

    1  using Microsoft.AspNetCore.Mvc;
    2  using Microsoft.AspNetCore.Mvc.Filters;
    3  ...
    4  namespace WebApp.Controllers
    5  {
    6      ...
    7      public class BaseController : Controller
    8      {
    9          ...
    10         private readonly IHttpContextAccessor _httpContextAccessor;
    11         ...
    12         public BaseController(IHttpContextAccessor httpContextAccessor)
    13         {
    14             _httpContextAccessor = httpContextAccessor;
    15         }
    16         ...
    17         public override void OnActionExecuting(ActionExecutingContext context)
    18         {
    19             base.OnActionExecuting(context);
    20             string username = context.HttpContext.Session.GetString("username");
    21             if (username == null)
    22             {
    23                 context.Result = RedirectToActionResult("Index", "Login");
    24             }
    25         }
    26     }

```

Figure 4.3.1: Base controller

The figure shows BaseController class is part of an authorization filter implemented using the on action executing method. It checks if a user is authenticated by looking for a session variable named "username". If the user is not logged in.

Board controller

```

    1  using Microsoft.AspNetCore.Mvc;
    2  using Microsoft.AspNetCore.Mvc.Filters;
    3  using Microsoft.EntityFrameworkCore;
    4  using WebApp.Data;
    5  using WebApp.Models;
    6  ...
    7  namespace WebApp.Controllers
    8  {
    9      ...
    10     public class BoardController : BaseController
    11     {
    12         ...
    13         private readonly ApplicationDbContext _db;
    14         ...
    15         public BoardController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
    16         {
    17             _db = db;
    18         }
    19         ...
    20         public IActionResult Index()
    21         {
    22             return View();
    23         }
    24         ...
    25         public IActionResult Board(int? id)
    26         {
    27             ...
    28             if (id == null)
    29             {
    30                 return NotFound();
    31             }
    32             ...
    33             var data = _db.Bards.Find(id);
    34             if (data == null)
    35             {
    36                 return NotFound();
    37             }
    38         }

```

Figure 4.3.2: Board controller

This figure shows the method to find a board with the specified ID from the database using the Find method of the db.Bboards property. If a board is found, the code snippet you provided doesn't show what the method does with it. However, if no board is found, the method returns a NotFound result.

Calendar controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the code for the `CalendarController.cs` file. The code implements a controller that inherits from `BaseController`. It uses `ApplicationDbContext` for data access. The `Calendar` method retrieves a calendar by its ID, returning a `NotFound` result if the ID is null or the record is not found. The `CreateCalendar` method handles the creation of a new calendar record. The bottom of the screen shows the Windows taskbar with various pinned icons.

```
1  using Microsoft.AspNetCore.Mvc;
2  using WebApp.Data;
3  using WebApp.Models;
4
5  namespace WebApp.Controllers
6  {
7      public class CalendarController : BaseController
8      {
9          private readonly ApplicationDbContext _db;
10
11         public CalendarController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
12         {
13             _db = db;
14         }
15
16
17         public IActionResult Calendar(int? id)
18         {
19             if (id == null)
20             {
21                 return NotFound();
22             }
23
24             var data = _db.workCalendars.Find(id);
25             if (data == null)
26             {
27                 return NotFound();
28             }
29             return Ok(data);
30         }
31
32         [HttpPost]
33         public IActionResult CreateCalendar(WorkCalendarModel obj)
```

Figure 4.3.3:Calendar controller

This figure shows the method of managing calendars. The `Calendar` method can retrieve a calendar by its ID from the database, and the `CreateCalendar` method can create a new calendar record.

Engagement plan controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the `EngagementPlanController.cs` file under the `WebApp` project. The code implements a controller for engagement plans, inheriting from `BaseController`. It includes methods for listing boards and retrieving a specific engagement plan by ID. The Solution Explorer on the right shows the project structure, including controllers like `EngagementPlanController`, `BoardController`, and `CalendarController`, as well as data models and views.

```

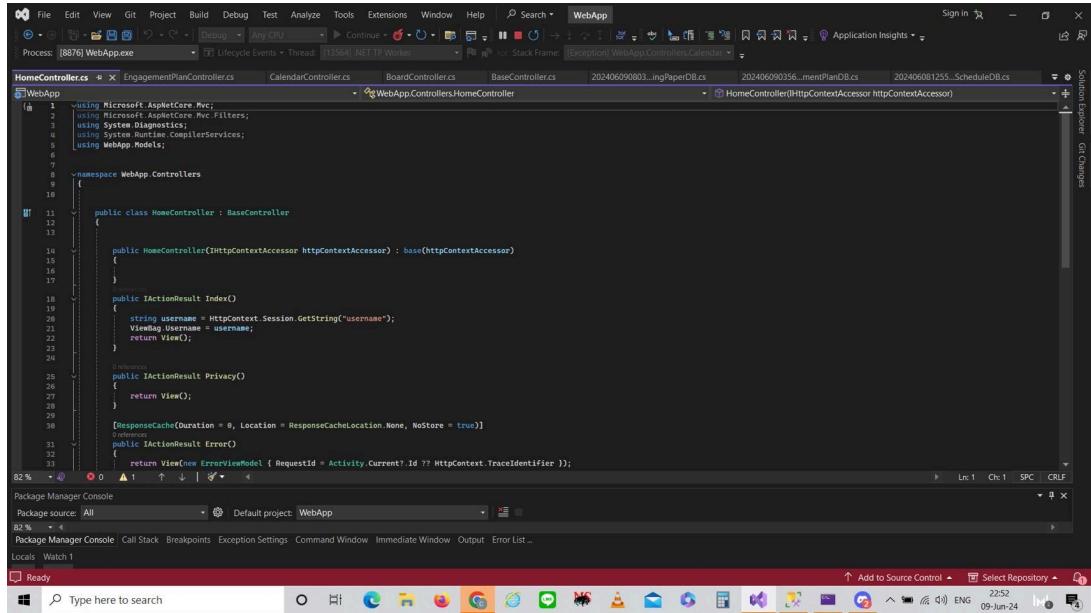

1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.EntityFrameworkCore;
3  using WebApp.Data;
4  using WebApp.Models;
5
6  namespace WebApp.Controllers
7  {
8      public class EngagementPlanController : BaseController
9      {
10         private readonly ApplicationDbContext _db;
11
12         public EngagementPlanController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
13         {
14             _db = db;
15         }
16
17         public async Task<ActionResult> Index()
18         {
19             var boards = await _db.Boards.ToListAsync();
20             ViewBag.Boards = boards;
21             return View();
22         }
23
24         public IActionResult EngagementPlan(int? id)
25         {
26             if (id == null)
27             {
28                 return NotFound();
29             }
30
31             var data = _db.EngagementPlans.Find(id);
32             if (data == null)
33             {
34                 return NotFound();
35             }
36         }
37     }
38 }

```

Figure 4.3.4:Engagement plan controller

The figure shows a `EngagementPlanController` class is responsible for handling HTTP requests related to engagement plans, and it inherits some common functionality from the base controller class.

Home controller

The screenshot shows the Visual Studio IDE interface with the code editor open to the `HomeController.cs` file. The code defines a `HomeController` class that inherits from `BaseController`. It contains three action methods: `Index`, `Privacy`, and `Error`. The `Index` method retrieves the `username` from the session and returns a view. The `Privacy` method returns a view. The `Error` method returns a view with a new `ErrorViewModel`. The code editor shows syntax highlighting and some annotations like `[ResponseCache]` and `[Activity]`. Below the code editor is the Package Manager Console window.

```
1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.AspNetCore.Mvc.Filters;
3  using System.Diagnostics;
4  using System.Runtime.CompilerServices;
5  using WebApp.Models;
6
7  namespace WebApp.Controllers
8  {
9      public class HomeController : BaseController
10     {
11         public HomeController(IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
12         {
13         }
14
15         public IActionResult Index()
16         {
17             string username = HttpContext.Session.GetString("username");
18             ViewBag.Username = username;
19             return View();
20         }
21
22         [ResponseCache(Duration = 0, Location = ResponseCacheLocation.None, NoStore = true)]
23         public IActionResult Privacy()
24         {
25             return View();
26         }
27
28         [ResponseCache(Duration = 0, Location = ResponseCacheLocation.None, NoStore = true)]
29         public IActionResult Error()
30         {
31             return View(new ErrorViewModel { RequestId = Activity.Current?.Id ?? HttpContext.TraceIdentifier });
32         }
33     }
34 }
```

Figure 4.3.5:Home controller

The figure shows a partial definition of the `ScheduleDB` class within the `Models` folder. This class likely serves as a data model for representing schedule information. The class name is `HomeController`, and it inherits from the `BaseController` class. In ASP.NET Core MVC, controllers handle HTTP requests from the web browser.

Audit controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the code for the `InspectionController.cs` file, which inherits from `BaseController`. The code handles inspection requests, including retrieving boards and managing specific inspections. The Solution Explorer on the right shows the project structure for the `WebApp` project, including controllers like `HomeController`, `BoardController`, and `InspectionController`, as well as various views and models.

```

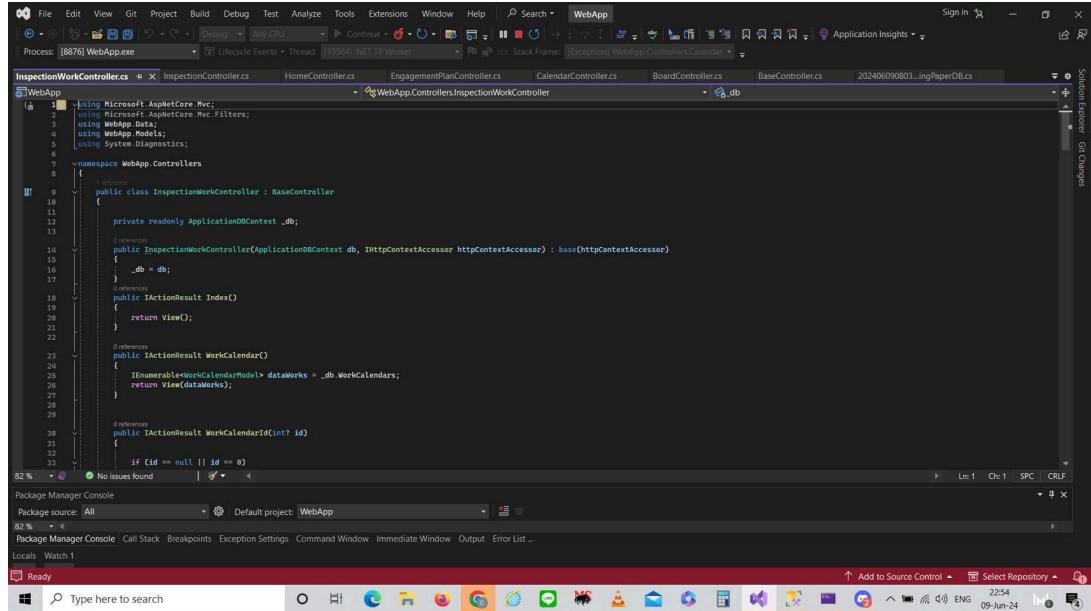

1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.EntityFrameworkCore;
3  using WebApp.Data;
4  using WebApp.Models;
5  using System.Collections.Specialized.BitVector32;
6
7  namespace WebApp.Controllers
8  {
9      [ApiController]
10     public class InspectionController : BaseController
11     {
12         private readonly ApplicationDbContext _db;
13
14         public InspectionController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
15         {
16             _db = db;
17         }
18
19         [HttpGet]
20         public async Task<ActionResult> Index()
21         {
22             var boards = await _db.Boards.ToListAsync();
23             ViewBag.Boards = boards;
24             return View();
25         }
26
27         [HttpGet]
28         public IActionResult Inspection(int? id)
29         {
30             if (id == null)
31             {
32                 return NotFound();
33             }
34
35             var data = _db.Inspections.Find(id);
36             if (data == null)
37             {
38
39             }
40         }
41     }
42 }

```

Figure 4.3.6: Audit controller

This figure defines an AuditController class that inherits from a base controller (`BaseController`) and handles functionality related to inspections. It retrieves inspection data from a database and interacts with views to display or potentially manage inspections.

Audit work controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the 'InspectionWorkController.cs' file under the 'WebApp' project. The code defines a class 'InspectionWorkController' that inherits from 'BaseController'. It includes methods for retrieving work calendar data and displaying it. The bottom status bar shows the date as 09-Jun-24.

```
using Microsoft.AspNetCore.Mvc;
using Microsoft.AspNetCore.Mvc.Filters;
using WebApp.Data;
using WebApp.Models;
using System.Diagnostics;

namespace WebApp.Controllers
{
    [ApiController]
    [Route("api/[controller]")]
    public class InspectionWorkController : BaseController
    {
        private readonly ApplicationDbContext _db;

        public InspectionWorkController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
        {
            _db = db;
        }

        [HttpGet]
        public IActionResult Index()
        {
            return View();
        }

        [HttpGet]
        public IActionResult WorkCalendar()
        {
            IEnumerable<WorkCalendarModel> dataWorks = _db.WorkCalendars;
            return View(dataWorks);
        }

        [HttpGet]
        public IActionResult WorkCalendarId(int? id)
        {
            if (id == null || id == 0)
            {
                return NotFound();
            }
            else
            {
                var workCalendar = _db.WorkCalendars.Find(id);
                if (workCalendar == null)
                {
                    return NotFound();
                }
                else
                {
                    return View(workCalendar);
                }
            }
        }
    }
}
```

Figure 4.3.7: Audit work controller

This figure defines a AuditWorkController class that inherits from a base controller (BaseController) and handles functionality related to work calendars. It retrieves work calendar data from a database and interacts with views to display them.

Login controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the `LoginController.cs` file under the `WebApp` project. The code implements a `LoginController` class that inherits from `Controller`. It uses `ApplicationDbContext` for database interaction. The `Index` action method handles user login, checking if the provided username and password match those in the database. If successful, it redirects to the `Index` view of the `Home` controller; if unsuccessful, it returns the `Index` view. The code also includes validation logic for the `AntiForgeryToken`.

```

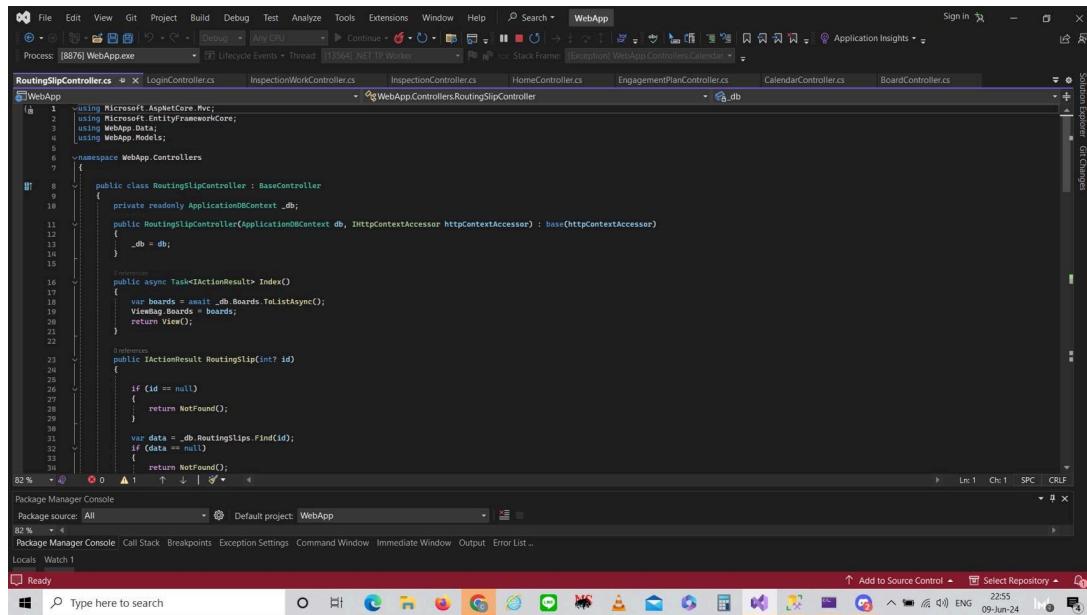

1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.EntityFrameworkCore;
3  using WebApp.Data;
4  using WebApp.Models;
5
6  namespace WebApp.Controllers
7  {
8      public class LoginController : Controller
9      {
10         private readonly ApplicationDbContext _db;
11
12         public LoginController(ApplicationDbContext db)
13         {
14             _db = db;
15         }
16
17         public IActionResult Index()
18         {
19             return View();
20         }
21
22         [HttpPost]
23         [ValidateAntiForgeryToken]
24         public IActionResult Index(UserModel user)
25         {
26             var userData = _db.Users.FirstOrDefault(u => u.username == user.username && u.password == user.password);
27             if (userData != null)
28             {
29                 HttpContext.Session.SetString("username", userData.username);
30                 return RedirectToAction("Index", "Home"); // Redirects to index view if successful
31             }
32         }
33     }
34 }

```

Figure 4.3.8:Login controller

This figure defines a `LoginController` class that handles user login functionality. It likely uses a `db` context to interact with a database (potentially for user authentication) and redirects to different views based on login success or failure.

Routing slip controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the `RoutingSlipController.cs` file under the `WebApp` project. The code defines a `RoutingSlipController` class that inherits from `BaseController`. It includes methods for listing all routing slips and viewing a specific slip. The code uses Entity Framework Core to interact with a database. The bottom of the screen shows the Windows taskbar with various pinned icons.

```
1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.EntityFrameworkCore;
3  using WebApp.Data;
4  using WebApp.Models;
5
6  namespace WebApp.Controllers
7  {
8      public class RoutingSlipController : BaseController
9      {
10         private readonly ApplicationDbContext _db;
11
12         public RoutingSlipController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
13         {
14             _db = db;
15         }
16
17         [HttpGet]
18         public async Task<ActionResult> Index()
19         {
20             var boards = await _db.Boards.ToListAsync();
21             ViewBag.Boards = boards;
22             return View();
23         }
24
25         [HttpGet]
26         public ActionResult RoutingSlip(int? id)
27         {
28             if (id == null)
29             {
30                 return NotFound();
31             }
32             var data = _db.RoutingSlips.Find(id);
33             if (data == null)
34             {
35                 return NotFound();
36             }
37             return View(data);
38         }
39     }
40 }
```

Figure 4.3.9:Routing slip controller

This figure defines a `SlipController` class that inherits from a base controller (`BaseController`) and handles functionality related to routing slips. It retrieves routing slip data from a database and interacts with views to display them (potentially listing all slips or viewing a specific slip).

Routing slip follow up controller

The screenshot shows the Visual Studio IDE interface. The main window displays the `RoutingSlipFollowUpController.cs` file under the `WebApp` project. The code defines a controller that interacts with a database context (`ApplicationDbContext`) to handle routing slip follow-up operations. The Solution Explorer on the right shows the project structure, including controllers like `BaseController`, `BoardController`, `EngagementPlanController`, `HomeController`, `InspectionController`, `LoginController`, and `RoutingSlipFollowUpController`. The status bar at the bottom indicates the system is ready.

```

using Microsoft.AspNetCore.Mvc;
using WebApp.Data;
using WebApp.Models;
namespace WebApp.Controllers
{
    [Route("api/[controller]")]
    public class RoutingSlipFollowUpController : BaseController
    {
        private readonly ApplicationDbContext _db;

        public RoutingSlipFollowUpController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
        {
            _db = db;
        }

        [HttpGet]
        public IActionResult RoutingSlipFollowUp(int? id)
        {
            if (id == null)
            {
                return NotFound();
            }

            var data = _db.RoutingSlipFollowUps.Find(id);
            if (data == null)
            {
                return NotFound();
            }
            return Ok(data);
        }

        [HttpPost]
        public IActionResult CreateRoutingSlipFollowUp(RoutingSlipFollowUpModel obj)
        {
            return Ok();
        }
    }
}

```

Figure 4.3.10: Routing slip follow up controller

This figure defines a `RoutingSlipFollowUpController` class that likely deals with following up on routing slips. It retrieves routing slip follow-up data from a database and potentially interacts with views to display or manage follow-up information.

Schedule controller

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the `ScheduleController.cs` file, which is a C# class definition for a controller. The code includes imports for `Microsoft.AspNetCore.Mvc`, `Microsoft.EntityFrameworkCore`, `WebApp.Data`, and `WebApp.Models`. It defines a constructor taking an `ApplicationDbContext` dependency and sets it to `_db`. The `Index` action retrieves all boards from the database and returns them as a view model. The `Schedule` action finds a schedule by its ID; if found, it returns it; otherwise, it returns a not-found response. The Solution Explorer on the right shows the project structure for "WebApp", including controllers like BaseController, BoardController, CalendarController, EngagementPlanController, HomeController, InspectionController, InspectionWorkController, LoginController, RoutingSlipController, and ScheduleController, along with models, views, and other project files.

```

using Microsoft.AspNetCore.Mvc;
using Microsoft.EntityFrameworkCore;
using WebApp.Data;
using WebApp.Models;

namespace WebApp.Controllers
{
    [Route("api/[controller]")]
    public class ScheduleController : BaseController
    {
        private readonly ApplicationDbContext _db;
        public ScheduleController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
        {
            _db = db;
        }

        [HttpGet]
        public async Task<ActionResult> Index()
        {
            var boards = await _db.Boards.ToListAsync();
            ViewBag.Boards = boards;
            return View();
        }

        [HttpGet]
        public ActionResult Schedule(int? id)
        {
            if (id == null)
            {
                return NotFound();
            }

            var data = _db.Schedules.Find(id);
            if (data == null)
            {
                return NotFound();
            }
        }
    }
}

```

Figure 4.3.11:Schedule controller

This figure defines a `ScheduleController` class that inherits from a base controller (`BaseController`) and handles scheduling functionality, likely related to inspections. It retrieves schedule data from a database and interacts with views to display or manage schedules.

User controller

The screenshot shows the Microsoft Visual Studio IDE interface. The top menu bar includes File, Edit, View, Git, Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help, and Search. The title bar says "WebApp". The status bar at the bottom right shows "22:56 09-Jun-24 ENG".

The code editor displays `UserController.cs` with the following content:

```
1  using Microsoft.AspNetCore.Mvc;
2  using WebApp.Data;
3  using WebApp.Models;
4
5  namespace WebApp.Controllers
6  {
7
8      public class UserController : Controller
9      {
10         private readonly ApplicationDbContext _db;
11
12         public UserController(ApplicationDbContext db)
13         {
14             _db = db;
15         }
16
17         public IActionResult Index()
18         {
19             Ienumerable<UserModel> allUser = _db.Users;
20             return View(allUser);
21         }
22
23         public IActionResult Create()
24         {
25             return View();
26         }
27
28         [HttpPost]
29         [ValidateAntiForgeryToken]
30         public IActionResult Create(UserModel obj)
31         {
32             _db.Users.Add(obj);
33         }
34     }
35 }
```

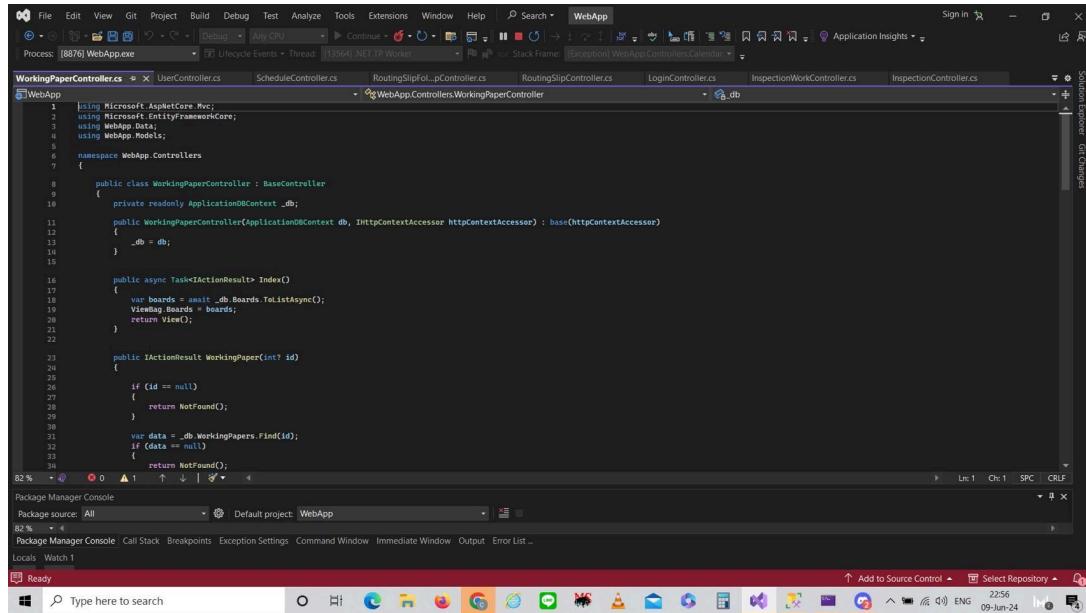

The status bar at the bottom left indicates "0 issues found".

The Solution Explorer sidebar on the right lists files like UserController.cs, ScheduleController.cs, RoutingSlipFol_pController.cs, RoutingSlipController.cs, LoginController.cs, InspectionWorkController.cs, InspectionController.cs, and HomeController.cs.

Figure 4.3.12:User controller

This figure defines a `UserController` class that handles user management functionalities. It retrieves user data from a database and interacts with views to display or manage users.

Working paper controller

The screenshot shows the Visual Studio IDE interface with the WorkingPaperController.cs file open in the main editor window. The code defines a controller class for working papers. It includes imports for Microsoft.AspNetCore.Mvc, Microsoft.EntityFrameworkCore, WebApp.Data, and WebApp.Models. The class is named WorkingPaperController and inherits from BaseController. It has two methods: Index() which retrieves a list of boards from the database, and WorkingPaper(int? id) which retrieves a specific working paper by ID. The IDE also shows other files like UserController.cs, ScheduleController.cs, and RoutingSlipfol_pController.cs in the solution. Below the editor is the Package Manager Console and a taskbar with various application icons.

```

1  using Microsoft.AspNetCore.Mvc;
2  using Microsoft.EntityFrameworkCore;
3  using WebApp.Data;
4  using WebApp.Models;
5
6  namespace WebApp.Controllers
7  {
8      public class WorkingPaperController : BaseController
9      {
10         private readonly ApplicationDbContext _db;
11
12         public WorkingPaperController(ApplicationDbContext db, IHttpContextAccessor httpContextAccessor) : base(httpContextAccessor)
13         {
14             _db = db;
15         }
16
17         public async Task<ActionResult> Index()
18         {
19             var boards = await _db.Boards.ToListAsync();
20             ViewBag.Boards = boards;
21             return View();
22         }
23
24         public IActionResult WorkingPaper(int? id)
25         {
26             if (id == null)
27             {
28                 return NotFound();
29             }
30
31             var data = _db.WorkingPapers.Find(id);
32             if (data == null)
33             {
34                 return NotFound();
35             }
36         }
37     }
38 }

```

Figure 4.3.13:Working paper controller

This figure defines a controller class for an ASP.NET Core MVC application that handles requests related to working papers. The Index method retrieves a list of boards from a database, and the WorkingPaper method retrieves a specific working paper by ID.

4.4 View

The view layer provides the UI necessary to interact with the application. It includes components needed to display the data and enables users to interact with that data. Figure 4.4.1, Figure 4.4.2, Figure 4.4.3, Figure 4.4.4, Figure 4.4.5, Figure 4.4.6, Figure 4.4.7, Figure 4.4.8, Figure 4.4.9, Figure 4.4.10 represent a code of view layer for each page of web application.

Board view

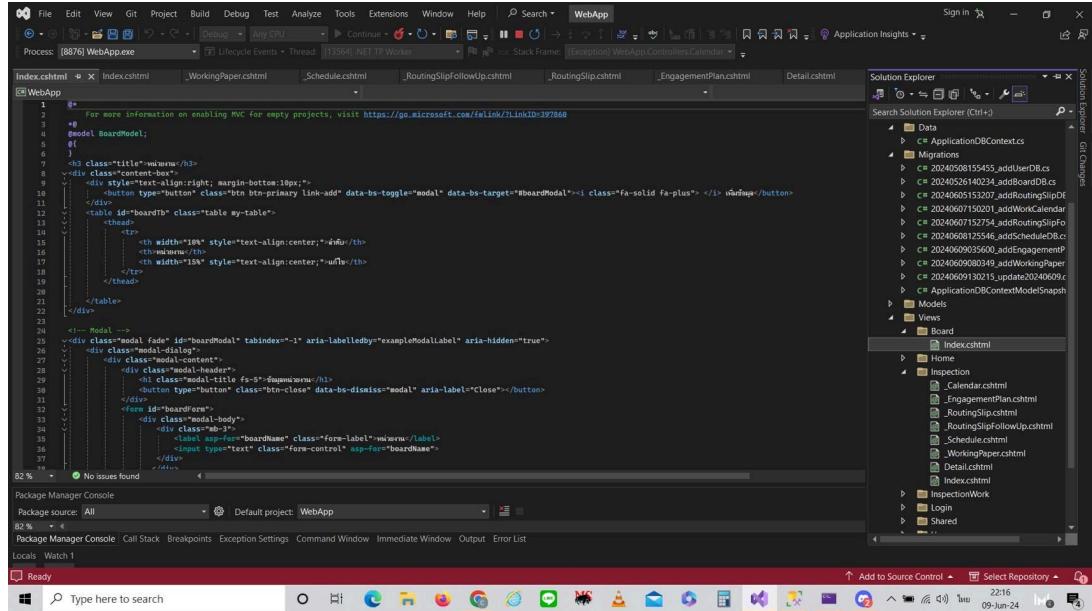

Figure 4.4.1: Board view

The Board view in the web application displays a list of faculties or departments. It presents information related to academic units within the organization, allowing users to view and manage faculty details efficiently through the application's interface.

Calendar view

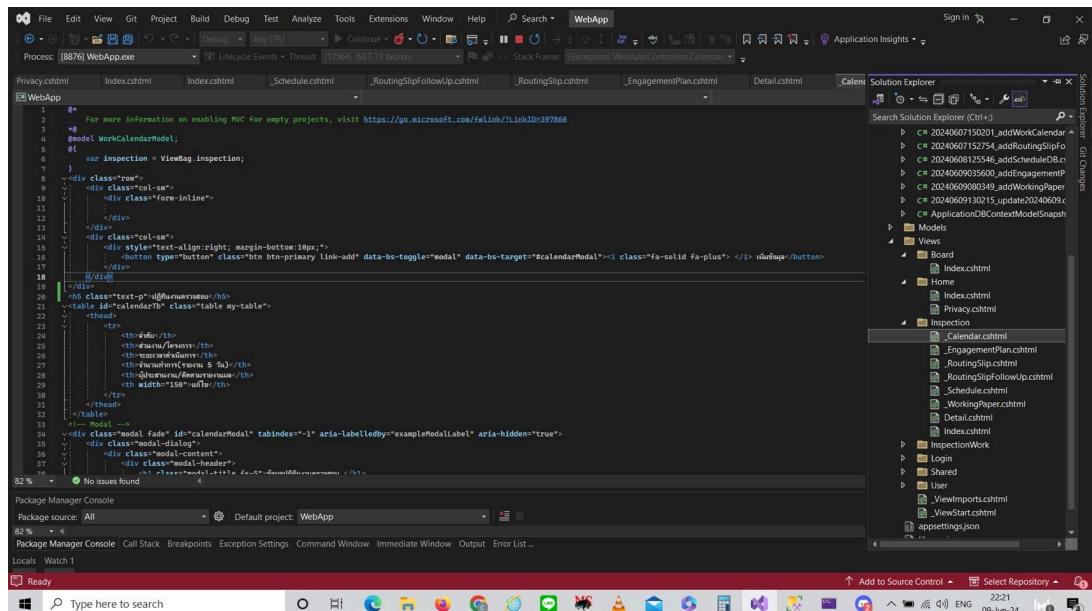

Figure 4.4.2: Calendar view

The Calendar view in the web application presents a table showing faculty names, durations, and auditors' names. This view provides a structured overview of scheduled activities and audits, facilitating organized management and planning within the application.

Engagement plan view

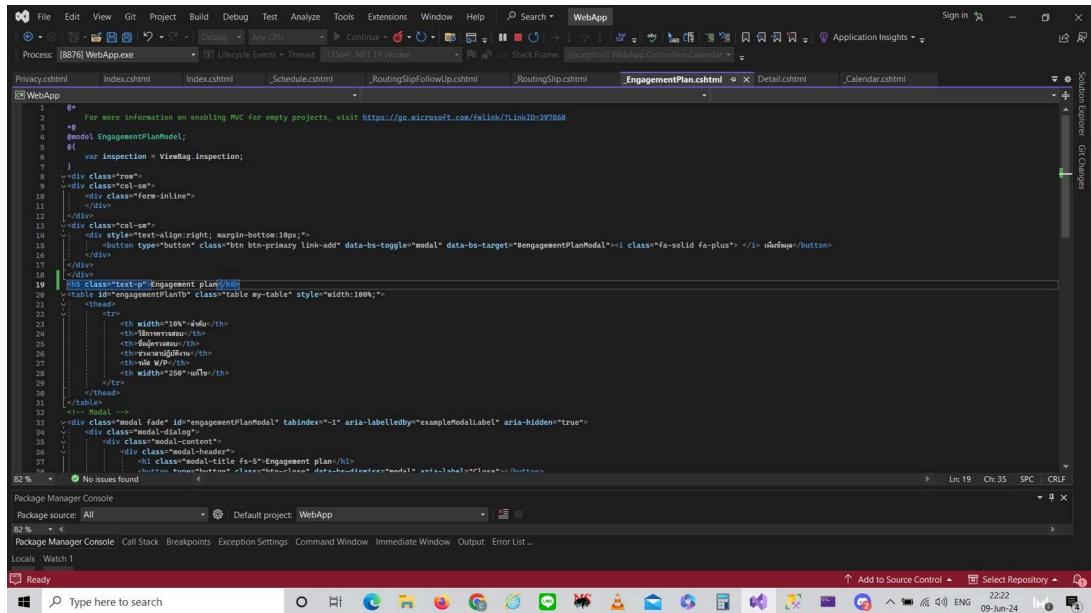

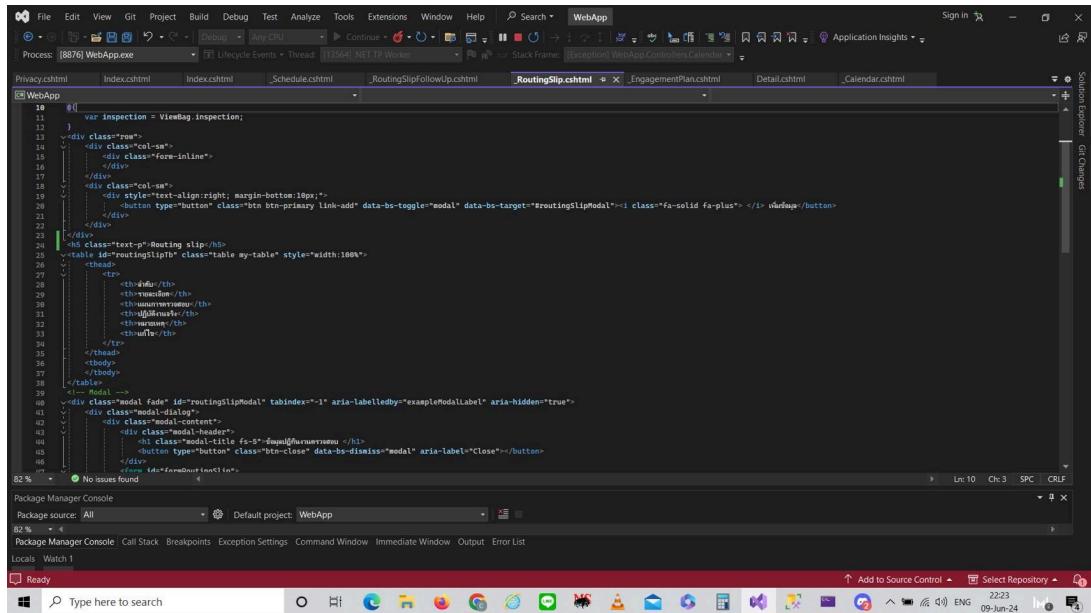

Figure 4.4.3: Engagement plan view

The Engagement Plan view in the web application displays information regarding auditing procedures and plans. It provides details such as engagement procedures, inspector names, and work hours allocated to each procedure. This view enables users to manage and monitor audit engagements effectively through the application's interface.

Audit Routing Slip view

The screenshot shows the Microsoft Visual Studio IDE interface. The main window displays the code for `RoutingSlip.cshtml`. The code includes HTML and CSS for a routing slip interface, featuring a modal dialog for adding new routing slips. The modal has a title "Audit Routing Slip", a close button, and a form with fields for "Audit Plan", "Work Plan", and "Comments". The main view shows a table with columns for "Audit Plan", "Work Plan", and "Comments". The bottom of the screen shows the Windows taskbar with various pinned icons.

```

10 @if (var inspection = ViewBag.inspection;
11 {
12     <div class="row">
13         <div class="col-sm">
14             <div class="form-inline">

Figure 4.4.5: Routing Slip FollowUp view

The Routing Slip Follow-Up view in the web application facilitates the monitoring and management of follow-up activities after audits. It allows users to input details such as follow-up actions, timelines (TimeN1 and TimeN2), and comments related to audit findings. This view enables auditors to track and update follow-up progress effectively, ensuring that audit recommendations are addressed and resolved in a timely manner.

Schedule view

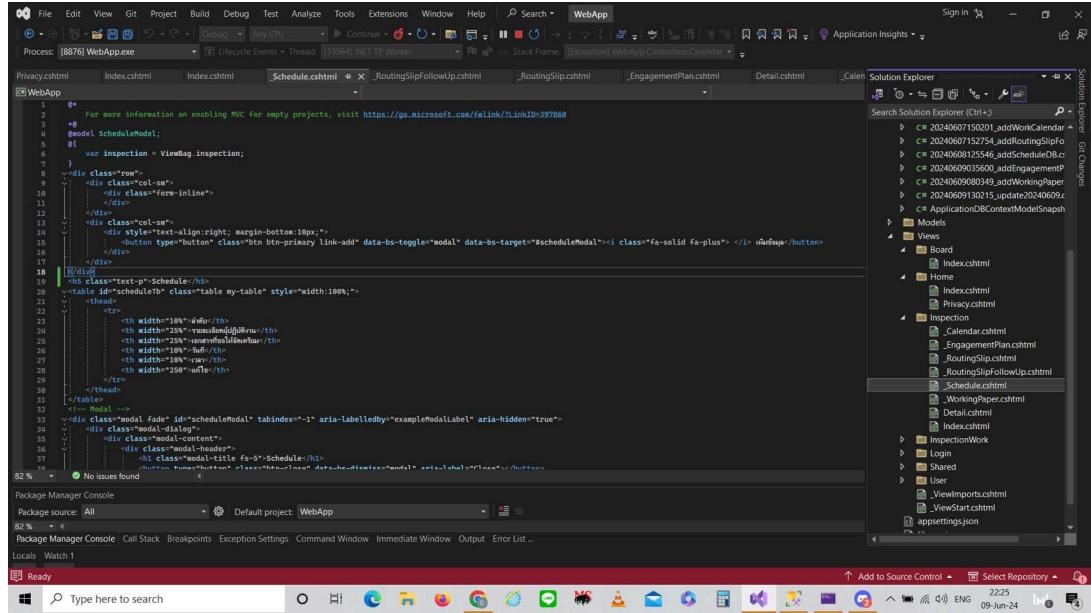

Figure 4.4.6: Schedule view

The Schedule view in the web application provides a structured display of scheduled activities related to audits. It includes fields for faculty names, durations, and auditors' names, offering a clear overview of planned audit schedules. This view allows users to manage and coordinate audit activities efficiently, ensuring that audits are conducted according to predefined timelines and with assigned auditors.

Figure 4.4.9: Index view

The Index view in the web application serves as the main landing page or dashboard that provides an overview of essential information and functionalities. It typically includes summarized data and quick links to key sections such as audits, schedules, reports, and user management. The Index view aims to offer a centralized hub where users can navigate and access various features of the auditing system efficiently. It serves as a starting point for users to interact with and manage different aspects of the audit process.

```

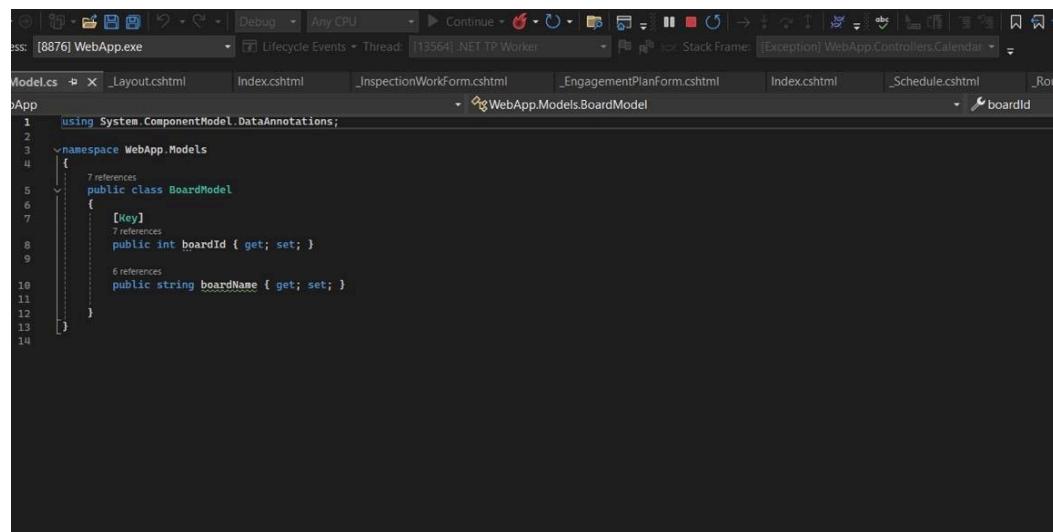

Figure 4.4.10: Login view

The Login view is where users enter their username and password to securely access the web application. Successful authentication grants them access to the system's features. It serves as the starting point for users to manage audit-related tasks and information.

4.5 Model

This section is about storing various information entered on each page. Each page stores different class and object and other information which includes collecting information of Board, Engagement plan, Error view, Audit, Routing Slip follow-up, Routing slip, Schedule, User, Working Calendar, and Workingpage.

Board model

The screenshot shows a Microsoft Visual Studio interface with the 'Model.cs' file open. The code defines a 'BoardModel' class with two properties: 'boardId' and 'boardName'. The 'boardId' property is annotated with '[Key]' and has 7 references. The 'boardName' property has 6 references. The code is as follows:

```
1 using System.ComponentModel.DataAnnotations;
2 
3 namespace WebApp.Models
4 {
5     public class BoardModel
6     {
7         [Key]
8         public int boardId { get; set; }
9 
10        public string boardName { get; set; }
11    }
12 }
13 
```

Figure 4.5.1: Board model

The Board model primarily stores information related to faculty names or departments. It is designed to capture and manage data regarding various academic units within the organization, facilitating organized and structured storage of this essential information.

Engagement plan model

```

using System.ComponentModel.DataAnnotations;
namespace WebApp.Models
{
    public class EngagementPlanModel
    {
        [Key]
        public int id { get; set; }

        public string how_check { get; set; }

        public string inspector { get; set; }

        public string working_hours { get; set; }

        public string pass_wp { get; set; }

        public int boardId { get; set; }

        public int inspectionId { get; set; }
    }
}

```

Figure 4.5.2:Engagement plan model

The Engagement Plan model is used to store all data related to the engagement plan procedures. It stores and manages information concerning the specific plans and procedures followed during auditing engagements, ensuring clarity and organization in the process.

Error view model

```

namespace WebApp.Models
{
    public class ErrorViewModel
    {
        public string? RequestId { get; set; }

        public bool ShowRequestId => !string.IsNullOrEmpty(RequestId);
    }
}

```

Figure 4.5.3: Error view model

The Error View model specifically contains and displays the request ID. It focuses on managing and presenting information related to individual request IDs, ensuring clarity and ease of access within the application.

Audit model

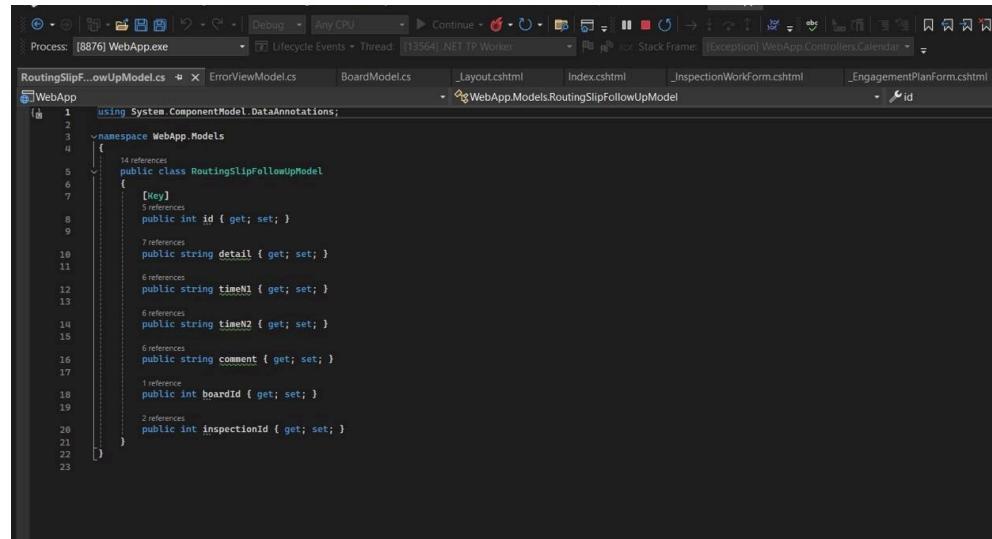

```
1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class InspectionModel
6      {
7          [Key]
8          public int inspectionId { get; set; }
9
10         public int boardId { get; set; }
11
12         public string inspectionName { get; set; }
13
14         public DateTime inspectionDate { get; set; }
15
16         public DateTime inspectionDateEnd { get; set; }
17
18         public string inspectionObjective { get; set; }
19
20         public string status { get; set; }
21     }
22 }
23
```

Figure 4.5.4: Audit model

The Audit model encompasses essential fields such as inspection ID, board ID, inspection name, inspection date start, inspection date end, inspection objective, and status. It serves to manage and track details pertaining to inspections conducted within the system, ensuring comprehensive oversight and management of audit processes.

Routing Slip follow-up model

```

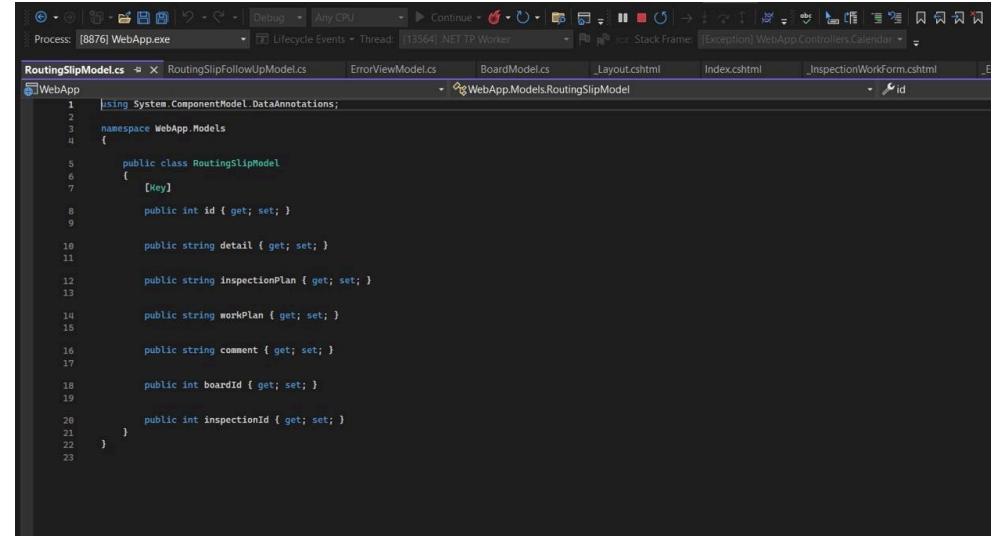

1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class RoutingSlipFollowUpModel
6      {
7          [Key]
8          public int id { get; set; }
9
10         public string detail { get; set; }
11
12         public string timeN1 { get; set; }
13
14         public string timeN2 { get; set; }
15
16         public string comment { get; set; }
17
18         public int boardId { get; set; }
19
20         public int inspectionId { get; set; }
21     }
22 }

```

Figure 4.5.5: Routing Slip follow-up model

The routing slip follow-up model is used to store all data related to the routing slip follow-up procedures. It stores and manages information concerning the specific plans and procedures.

Routing slip model

```

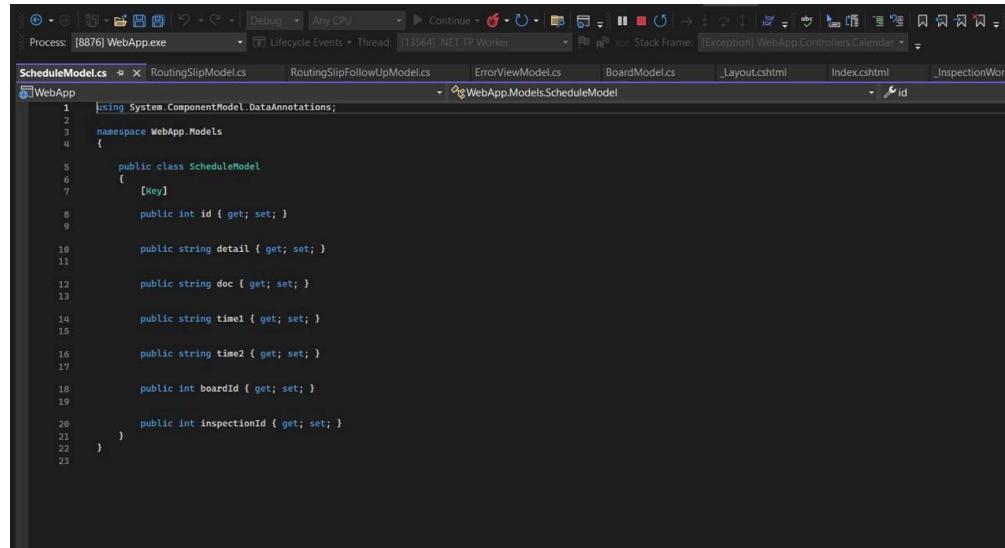

1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class RoutingSlipModel
6      {
7          [Key]
8          public int id { get; set; }
9
10         public string detail { get; set; }
11
12         public string inspectionPlan { get; set; }
13
14         public string workPlan { get; set; }
15
16         public string comment { get; set; }
17
18         public int boardId { get; set; }
19
20         public int inspectionId { get; set; }
21     }
22 }

```

Figure 4.5.6: Routing slip model

The routing slip model is used to store all data related to the routing slip procedures. It stores and manages information concerning the specific procedures.

Schedule model

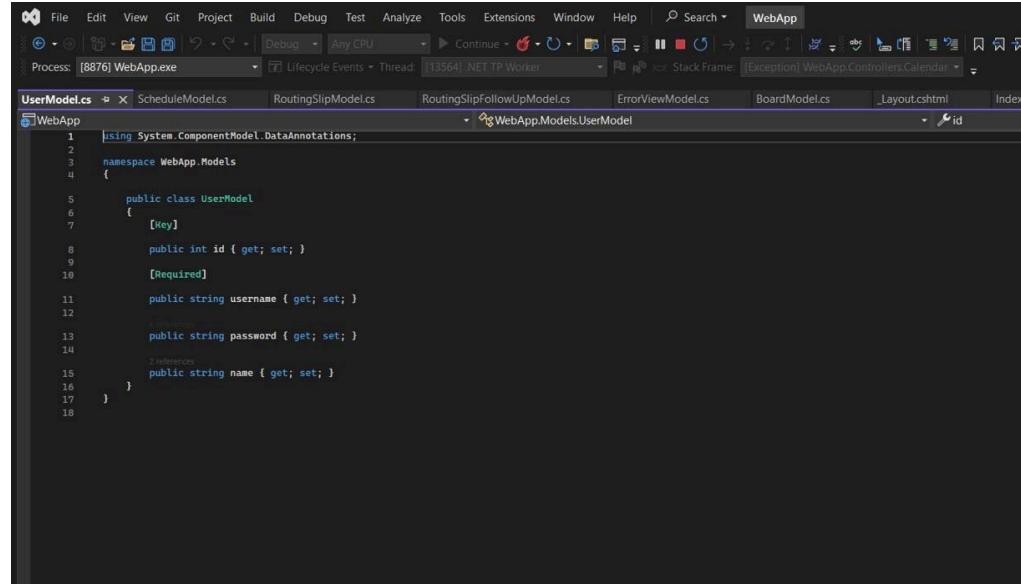

A screenshot of a Microsoft Visual Studio IDE window. The title bar shows "Process: [8876] WebApp.exe". The tabs at the top include "ScheduleModel.cs", "RoutingSlipModel.cs", "RoutingSlipFollowUpModel.cs", "ErrorViewModel.cs", "BoardModel.cs", "_Layout.cshtml", "Index.cshtml", and "InspectionWor...". The main code editor area displays the following C# code:

```
1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class ScheduleModel
6      {
7          [Key]
8          public int id { get; set; }
9
10         public string detail { get; set; }
11
12         public string doc { get; set; }
13
14         public string time1 { get; set; }
15
16         public string time2 { get; set; }
17
18         public int boardId { get; set; }
19
20         public int inspectionId { get; set; }
21     }
22 }
```

Figure 4.5.7: Schedule model

The schedule model is used to store all data related to the schedule procedures. It stores and manages information concerning the specific schedule.

User model

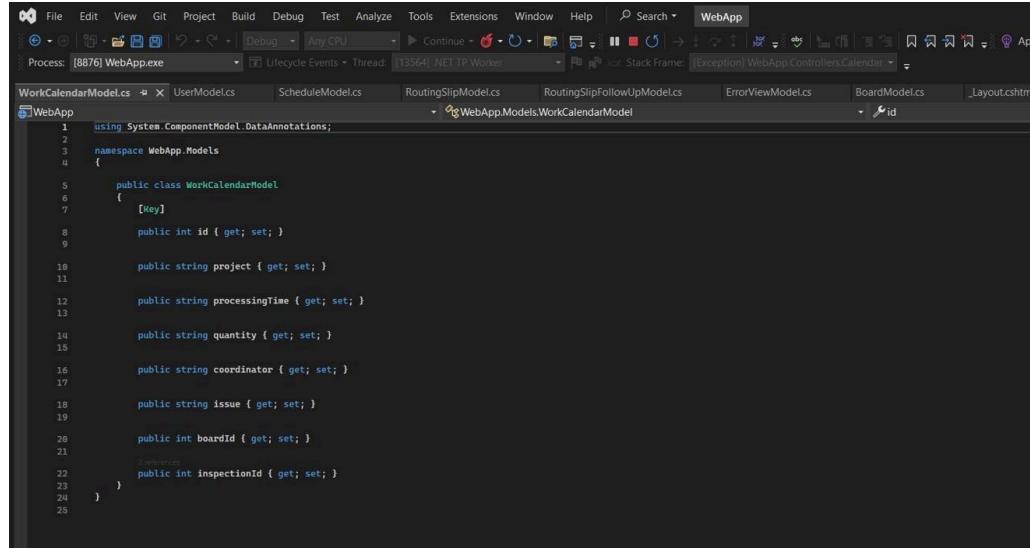

The screenshot shows a code editor window titled "UserModel.cs" within a project named "WebApp". The code defines a class "UserModel" with the following properties:

```
1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class UserModel
6      {
7          [Key]
8          public int id { get; set; }
9          [Required]
10         public string username { get; set; }
11         public string password { get; set; }
12         public string name { get; set; }
13     }
14 }
15
16
17
18
```

Figure 4.5.8: User model

The User model includes fields for ID, username, password, and name. It is designed to store and manage user credentials and personal information within the application, ensuring secure authentication and personalized user interactions.

Working Calendar model

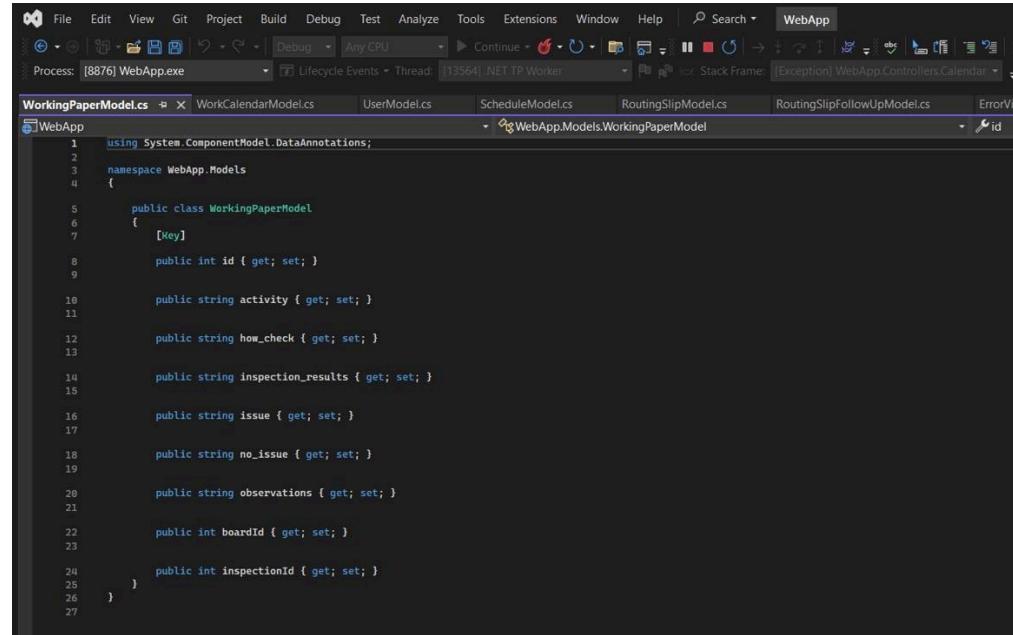

The screenshot shows a Microsoft Visual Studio interface with the title bar "WebApp". The menu bar includes File, Edit, View, Git, Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help, and a search bar. Below the menu is a toolbar with various icons. The main window displays the code for "WorkCalendarModel.cs" under the "WebApp" project. The code defines a class "WorkCalendarModel" with properties: id, project, processingTime, quantity, coordinator, issue, boardId, and inspectionId. The "id" property is annotated with [Key]. The "boardId" property has a [Reference] annotation.

```
1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class WorkCalendarModel
6      {
7          [Key]
8          public int id { get; set; }
9
10         public string project { get; set; }
11
12         public string processingTime { get; set; }
13
14         public string quantity { get; set; }
15
16         public string coordinator { get; set; }
17
18         public string issue { get; set; }
19
20         public int boardId { get; set; }
21
22         [Reference]
23         public int inspectionId { get; set; }
24     }
25 }
```

Figure 4.5.9: Working Calendar model

The Working Calendar model stores data related to the working calendar within the application activities to ensure projects are executed efficiently and on schedule.

WorkingPaper model

A screenshot of the Microsoft Visual Studio IDE interface. The title bar says "WebApp". The menu bar includes File, Edit, View, Git, Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help, and Search. The toolbar has various icons for file operations like Open, Save, and Build. The status bar at the bottom shows "Process: [8876] WebApp.exe", "Lifecycle Events", "Thread: [13564] .NET Tp Worker", and "Stack Frame: [Exception] WebApp.Controllers.Calendar". The main code editor window displays the "WorkingPaperModel.cs" file under the "WebApp" project. The code defines a class "WorkingPaperModel" with properties for id, activity, how_check, inspection_results, issue, no_issue, observations, boardId, and inspectionId, each annotated with [Key] and [Required].

```
1  using System.ComponentModel.DataAnnotations;
2
3  namespace WebApp.Models
4  {
5      public class WorkingPaperModel
6      {
7          [Key]
8          public int id { get; set; }
9
10         public string activity { get; set; }
11
12         public string how_check { get; set; }
13
14         public string inspection_results { get; set; }
15
16         public string issue { get; set; }
17
18         public string no_issue { get; set; }
19
20         public string observations { get; set; }
21
22         public int boardId { get; set; }
23
24     }
25
26 }
```

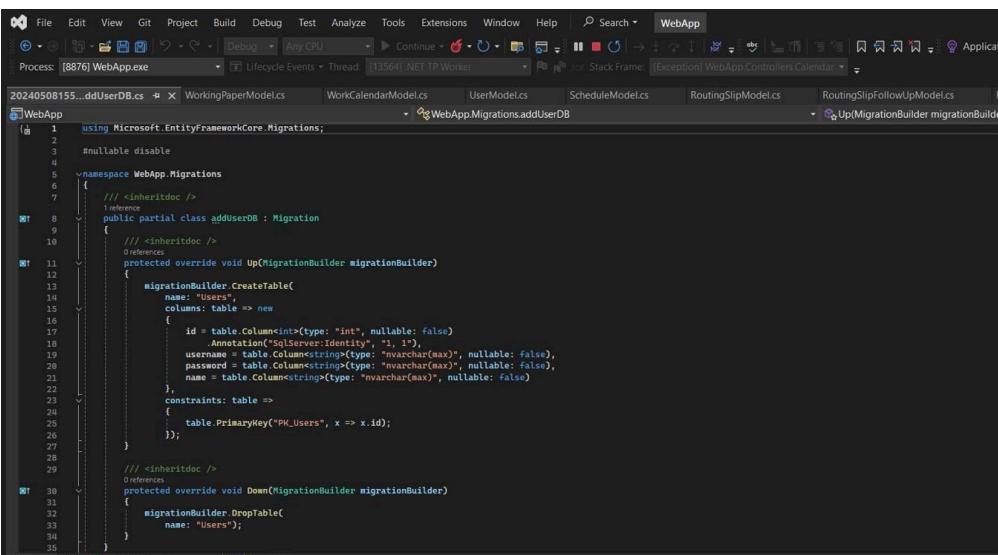

Figure 4.5.10: Workingpaper model

The Working Paper model stores data related to audit activities within the application. It manages information about audit procedures, documentation requirements, inspection results, issues identified, and any additional remarks. This model facilitates comprehensive tracking and management of audit-related data throughout the auditing process

4.6 Migrations

This section pertains to migrating data from different pages Board, Engagement Plan, Error View, Audit, Routing Slip Follow-up, Routing Slip, Schedule, User, Working Calendar, and Working Paper into corresponding database tables. Migration involves converting these entities into database schema using Entity Framework migrations. This ensures data consistency and facilitates efficient data storage and retrieval aligned with application needs.

Add user migrations

The screenshot shows the Visual Studio IDE interface with the 'WebApp' project selected. The 'WorkingPaperModel.cs' file is open, and the code editor displays the 'addUserDB' migration class. The code defines a partial class 'addUserDB' that inherits from 'Migration'. It contains methods for creating a 'Users' table with columns for id, username, password, and name, and for dropping the table. The code uses annotations like [Table] and [Column] to define the database schema.

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      // <inheritdoc />
8      public partial class addUserDB : Migration
9      {
10          // <inheritdoc />
11          protected override void Up(MigrationBuilder migrationBuilder)
12          {
13              migrationBuilder.CreateTable(
14                  name: "Users",
15                  columns: table => new
16                  {
17                      id = table.Column<int>(type: "int", nullable: false)
18                          .Annotation("SqlServer:Identity", "1, 1"),
19                      username = table.Column<string>(type: "nvarchar(max)", nullable: false),
20                      password = table.Column<string>(type: "nvarchar(max)", nullable: false),
21                      name = table.Column<string>(type: "nvarchar(max)", nullable: false)
22                  },
23                  constraints: table =>
24                  {
25                      table.PrimaryKey("PK_Users", x => x.id);
26                  });
27          }
28
29          // <inheritdoc />
30          protected override void Down(MigrationBuilder migrationBuilder)
31          {
32              migrationBuilder.DropTable(
33                  name: "Users");
34          }
35      }
36  }

```

Figure 4.6.1: Add user migrations

This figure shows the DbContext class for an ASP.NET Core MVC application. The DbContext class provides access to the database and the code snippet shows that it includes a DbSet for a User model with an Id property as the primary key.

Add board migration

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      // <inheritdoc />
8
9      public partial class addBoardDB : Migration
10     {
11         // <inheritdoc />
12         protected override void Up(MigrationBuilder migrationBuilder)
13         {
14             migrationBuilder.CreateTable(
15                 name: "Boards",
16                 columns: table => new
17                 {
18                     id = table.Column<int>(type: "int", nullable: false)
19                         .Annotation("SqlServer:Identity", "1, 1"),
20                     name = table.Column<string>(type: "nvarchar(max)", nullable: false),
21                     detail = table.Column<nvarchar(max)>(type: "nvarchar(max)", nullable: false),
22                     workPlan = table.Column<string>(type: "nvarchar(max)", nullable: false),
23                     comment = table.Column<string>(type: "nvarchar(max)", nullable: false),
24                     boardId = table.Column<int>(type: "int", nullable: false)
25                 },
26                 constraints: table =>
27                 {
28                     table.PrimaryKey("PK_Boards", x => x.boardId);
29                 });
30         }
31
32         // <inheritdoc />
33         protected override void Down(MigrationBuilder migrationBuilder)
34         {
35             migrationBuilder.DropTable(
36                 name: "Boards");
37         }
38     }
39 }
40 
```

Figure 4.6.2: Add board migrations

This figure is part of a migration that defines a table to display a list of users and store a collection of users and displays their name and role in a table format.

Add routing slip migrations

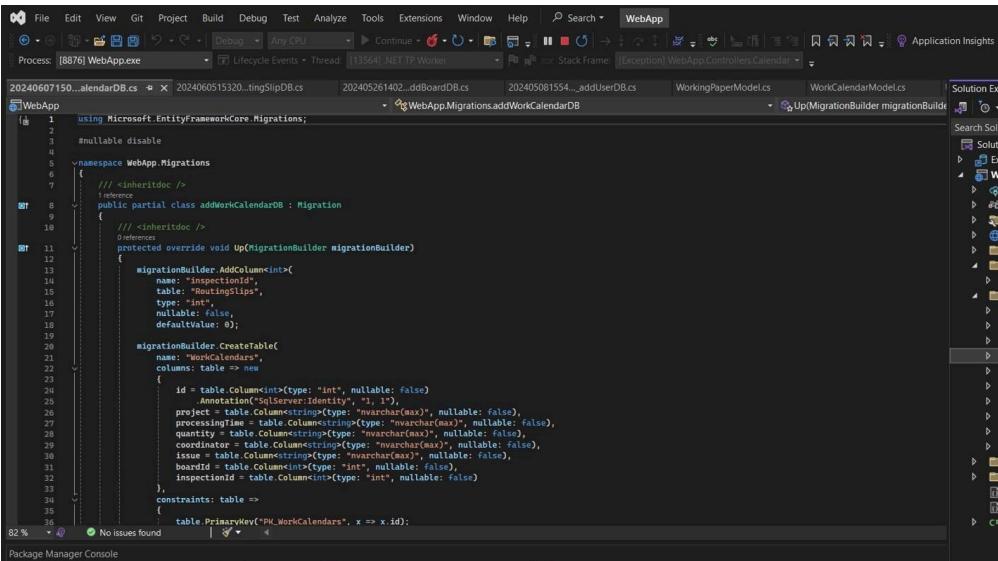

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      // <inheritdoc />
8
9      public partial class addRoutingSlipDB : Migration
10     {
11         // <inheritdoc />
12         protected override void Up(MigrationBuilder migrationBuilder)
13         {
14             migrationBuilder.CreateTable(
15                 name: "RoutingSlips",
16                 columns: table => new
17                 {
18                     id = table.Column<int>(type: "int", nullable: false)
19                         .Annotation("SqlServer:Identity", "1, 1"),
20                     name = table.Column<string>(type: "nvarchar(max)", nullable: false),
21                     detail = table.Column<nvarchar(max)>(type: "nvarchar(max)", nullable: false),
22                     workPlan = table.Column<string>(type: "nvarchar(max)", nullable: false),
23                     comment = table.Column<string>(type: "nvarchar(max)", nullable: false),
24                     boardId = table.Column<int>(type: "int", nullable: false)
25                 },
26                 constraints: table =>
27                 {
28                     table.PrimaryKey("PK_RoutingSlips", x => x.id);
29                 });
30         }
31
32         // <inheritdoc />
33         protected override void Down(MigrationBuilder migrationBuilder)
34         {
35             migrationBuilder.DropTable(
36                 name: "RoutingSlips");
37         }
38     }
39 }
40 
```

Figure 4.6.3: Add routing slip migrations

This figure is part of a migration in an ASP.NET Core MVC application that adds a new table named WorkCalendars to the database. The table is used to store work calendar information, which includes a schedule ID, day of work, start time, end time, and a description.

Add work calendar migrations

The screenshot shows the Visual Studio IDE interface with the following details:

- File Bar:** File, Edit, View, Git, Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help.
- Toolbars:** Standard, Debug, Windows, Help.
- Status Bar:** Application Insights, Process: [8876] WebApp.exe, Lifecycle Events > Thread: [13564] .NET FWP Worker, Stack Frame: [Exception] WebApp.Controllers.Calendar, Solution Explorer, Search Tools, Solution Explorer, Properties, Task List, Error List, Output, Tools, Help.
- Solution Explorer:** Shows the project structure with files like 20240607150...calendarDB.cs, 202406051530...tingSlipDB.cs, 202405261402...ddBoardDB.cs, 202405081554..._addUserDB.cs, WorkingPaperModel.cs, WorkCalendarModel.cs, and Up(MigrationBuilder migrationBuilder).
- Code Editor:** Displays the code for the migration class `WebApp.Migrations.addWorkCalendarDB`:

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  namespace WebApp.Migrations
4  {
5      // <inheritdoc/>
6      public partial class addWorkCalendarDB : Migration
7      {
8          // <inheritdoc/>
9          protected override void Up(MigrationBuilder migrationBuilder)
10         {
11             migrationBuilder.AddColumn<int>(
12                 name: "inspectionId",
13                 table: "RoutingSlips",
14                 type: "int",
15                 nullable: false,
16                 defaultValue: 0);
17
18             migrationBuilder.CreateTable(
19                 name: "WorkCalendars",
20                 columns: table => new
21                 {
22                     id = table.Column<int>(type: "int", nullable: false)
23                         .Annotation("SqlServer:Identity", "1,1"),
24                     processingTime = table.Column<string>(type: "nvarchar(max)", nullable: false),
25                     quantity = table.Column<string>(type: "nvarchar(max)", nullable: false),
26                     coordinator = table.Column<string>(type: "nvarchar(max)", nullable: false),
27                     inspection = table.Column<string>(type: "nvarchar(max)", nullable: false),
28                     boardId = table.Column<int>(type: "int", nullable: false),
29                     inspectionId = table.Column<int>(type: "int", nullable: false)
30                 },
31                 constraints: table =>
32                 {
33                     table.PrimaryKey("PK_WorkCalendars", x => x.id);
34                 }
35             );
36         }
37     }
38 }
```
- Bottom Status:** 82%, No issues found.

Figure 4.6.4: Add work calendar migrations

This figure is a part of a migration in an ASP.NET Core MVC application that adds a work calendar. The collection of strings is passed from the controller to the view using the ViewData property.

Add routing slip follow-up migrations

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      //<inheritdoc doc=>
8
9      public partial class addRoutingSlipFollowupDB : Migration
10     {
11         //<inheritdoc doc=>
12
13         protected override void Up(MigrationBuilder migrationBuilder)
14         {
15             migrationBuilder.CreateTable(
16                 name: "RoutingSlipFollowups",
17                 columns: table => new
18                 {
19                     id = table.Column<int>(type: "int", nullable: false)
20                         .Annotation("SqlServer:Identity", "1, 1"),
21                     detail = table.Column<string>(type: "nvarchar(max)", nullable: false),
22                     timeIn = table.Column<string>(type: "nvarchar(max)", nullable: false),
23                     timeOut = table.Column<string>(type: "nvarchar(max)", nullable: false),
24                     comment = table.Column<string>(type: "nvarchar(max)", nullable: false),
25                     boardId = table.Column<int>(type: "int", nullable: false),
26                     inspectionId = table.Column<int>(type: "int", nullable: false)
27                 },
28                 constraints: table =>
29                 {
30                     table.PrimaryKey("PK_RoutingSlipFollowups", x => x.id);
31                 });
32
33         //<inheritdoc doc=>
34
35         protected override void Down(MigrationBuilder migrationBuilder)
36         {
37             migrationBuilder.DropTable(
38                 name: "RoutingSlipFollowups");
39         }
40     }
41
42     //<inheritdoc doc=>
43
44     protected override void OnModelCreating(ModelBuilder modelBuilder)
45     {
46         base.OnModelCreating(modelBuilder);
47     }
48 }

```

Figure 4.6.5: Add routing slip follow-up migrations

This figure is a part of a migration in an ASP.NET Core MVC application that adds a new table named `RoutingSlipFollowups` to the database. The table is used to store routing slip follow ups, which include information such as the routing slip ID, follow up by, follow up at, description, and associated board and inspection IDs.

Add schedule migrations

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      /// <inheritdoc />
8
9      public partial class addScheduleDB : Migration
10     /// <inheritdoc />
11
12     protected override void Up(MigrationBuilder migrationBuilder)
13     {
14         migrationBuilder.CreateTable(
15             name: "Schedules",
16             columns: table => new
17             {
18                 id = table.Column<int>(type: "int", nullable: false)
19                     .Annotation("SqlServer:Identity", "1, 1"),
20                 detail = table.Column<string>(type: "nvarchar(max", nullable: false),
21                     maxLength: 255),
22                 doc = table.Column<string>(type: "nvarchar(max", nullable: false),
23                     maxLength: 255),
24                 time = table.Column<string>(type: "nvarchar(max", nullable: false),
25                     maxLength: 255),
26                 boardId = table.Column<int>(type: "int", nullable: false),
27                 inspectionId = table.Column<int>(type: "int", nullable: false)
28             },
29             constraints: table =>
30             {
31                 table.PrimaryKey("PK_Schedules", x => x.id);
32             });
33     }
34
35     /// <inheritdoc />
36
37     protected override void Down(MigrationBuilder migrationBuilder)
38     {
39         migrationBuilder.DropTable(
40             name: "Schedules");
41     }
42 }

```

Figure 4.6.6: Add schedule migrations

This figure defines a table to display a list of scheduled elements that define the header cells for the table. The header contains text labels for the schedule details (ID, Detail, Doc, Time, BoardId, InspectionId).

Add engagement plan migrations

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  #nullable disable
4
5  namespace WebApp.Migrations
6  {
7      /// <inheritdoc />
8
9      public partial class addEngagementPlanDB : Migration
10     /// <inheritdoc />
11
12     protected override void Up(MigrationBuilder migrationBuilder)
13     {
14         migrationBuilder.CreateTable(
15             name: "EngagementPlans",
16             columns: table => new
17             {
18                 id = table.Column<int>(type: "int", nullable: false)
19                     .Annotation("SqlServer:Identity", "1, 1"),
20                 how_check = table.Column<string>(type: "nvarchar(max", nullable: false),
21                     maxLength: 255),
22                 inspect_by = table.Column<string>(type: "nvarchar(max", nullable: false),
23                     maxLength: 255),
24                 pass_by = table.Column<string>(type: "nvarchar(max", nullable: false),
25                     maxLength: 255),
26                 boardId = table.Column<int>(type: "int", nullable: false),
27                 inspectionId = table.Column<int>(type: "int", nullable: false)
28             },
29             constraints: table =>
30             {
31                 table.PrimaryKey("PK_EngagementPlans", x => x.id);
32             });
33     }
34
35     /// <inheritdoc />
36
37     protected override void Down(MigrationBuilder migrationBuilder)
38     {
39         migrationBuilder.DropTable(
40             name: "EngagementPlans");
41     }
42 }

```

Figure 4.6.7: Add engagement plan migrations

This figure shows a migration in an migration in an ASP.NET Core MVC application that adds a new table named EngagementPlans to the database. The table is used to store engagement plan records, which include information such as the name, checklist, description, and due date.

Add working paper migrations

```

1  using Microsoft.EntityFrameworkCore.Migrations;
2
3  namespace WebApp.Migrations
4  {
5      // <inheritdoc doc=">
6      [assembly: AssemblyPostProcesser]
7      public partial class addWorkingPaperDB : Migration
8      {
9          // <inheritdoc doc=">
10
11         protected override void Up(MigrationBuilder migrationBuilder)
12         {
13             migrationBuilder.CreateTable(
14                 name: "WorkingPapers",
15                 columns: table => new
16                 {
17                     id = table.Column<int>(type: "int", nullable: false)
18                         .Annotation("SqlServerIdentity", "1, 1"),
19                     activity = table.Column<string>(type: "nvarchar(max)", nullable: false),
20                     inspection_results = table.Column<string>(type: "nvarchar(max)", nullable: false),
21                     issue = table.Column<string>(type: "nvarchar(max)", nullable: false),
22                     no_issue = table.Column<string>(type: "nvarchar(max)", nullable: false),
23                     observation = table.Column<string>(type: "nvarchar(max)", nullable: false),
24                     boardid = table.Column<int>(type: "int", nullable: false),
25                     inspectionId = table.Column<int>(type: "int", nullable: false)
26                 },
27                 constraints: table =>
28                 {
29                     table.PrimaryKey("PK_WorkingPapers", x => x.id);
30                 }
31             );
32         }
33
34         // <inheritdoc doc=">
35         protected override void Down(MigrationBuilder migrationBuilder)
36         {
37             migrationBuilder.DropTable(
38                 name: "WorkingPapers");
39         }
40     }
41
42     // No issues found
43 
```

Figure 4.6.8: Add working paper migrations

This figure shows a migration in an ASP.NET Core MVC application that adds a new table named WorkingPapers to the database. The table is used to store working paper records, which include information such as the activity, inspection results, issues, observations, and associated board and inspection IDs.

CHAPTER 5

TESTING AND EVALUATION

5.1 Unit Tests

For the unit tests, we selected some important and critical processes for formal unit testing. The selected processes include:

- Audit work calendar
- Routing slip
- Schedule

5.2 Test Performed on Audit work calendar

Table 5.2: Audit work calendar

Operation Performed	Condition Tested	Actual Result
Add a new Audit work to the calendar	To ensure that the new event is successfully added to the calendar	The event is successfully added to the calendar
Edit the data in the table	To edit the data in the Audit work calendar	The data is successfully edited and saved
Display the data in the table to the user	The data in the table should be displayed to the user	The data in the table is successfully displayed in the table

5.3 Test Performed on Routing slip

Table 5.3: Routing slip

Operation Performed	Condition Tested	Actual Result
Add a new routing slip data to the table	To ensure that the new data is successfully added to the routing slip	The data is successfully added to the routing slip
Edit the data in the table	To edit the data in the routing slip table	The data is successfully edited and saved
Display the data in the table to the user	The data in the table should be displayed to the user	The data in the table is successfully displayed in the table

5.4 Test Performed on Schedule

Table 5.4: Schedule

Operation Performed	Condition Tested	Actual Result
Add a new routing slip data to the table	To ensure that the new data is successfully added to the routing slip	The data is successfully added to the routing slip
Edit the data in the table	To edit the data in the routing slip table	The data is successfully edited and saved

Display the data in the table to the user	The data in the table should be displayed to the user	The data in the table is successfully displayed in the table
---	---	--

5.5 System Integration Test

This activity is performed after the system is completely integrated. The purpose of this testing is to check whether the system can operate correctly according to the required functions or not.

Test Scenario

In order to test all functional aspects of the system thoroughly, we had set up a test scenario which consisted of phases as shown below.

- System initialization
- User authentication
- Data input and editing
- System integration
- Performance and scalability

Moreover, the test scenario can be used as a user guideline because it covers all the steps necessary in order to use our system. The details of each phase are shown in the next section.

5.5.1 System initialization

1. Start the system.
2. Verify that all essential modules load without errors.
3. Check system logs for any initialization issues.

5.5.2 User authentication

1. Enter valid user credentials.

2. Verify successful login.
3. Test login failure with invalid.

5.5.3 Data input and editing

1. Input new data into the system.
2. Edit existing data record.
3. Verify that changes are saved correctly.

5.5.4 System integration

1. Integrate with external databases or APIs.
2. Test data exchange between systems.
3. Confirm compatibility and data integrity.

5.5.5 Performance and scalability

1. Perform load testing with simulated user traffic.
2. Measure response times and system stability.
3. Test scalability by increasing user load and data volume.

CHAPTER 6

CONCLUSION

Overall, this project demonstrates the potential of web applications to self-modify applications by combining advanced features and functionality, such as using code knowledge with auditing. The web applications have achieved important goals and greatly improved the efficiency and fluency of the audit process.

6.1 Benefits

6.1.1 Benefits to Project Developers

- The development of this metaverse education platform has allowed project developers to showcase our innovation and technical expertise in merging content with VR technology.
- Developers have gained hands-on experience in addressing technical issues, refining user interfaces, and optimizing content delivery.
- Integrating the program workflow bridge between Unity and Blender has provided project developers with a streamlined workflow and enhanced collaboration capabilities.

6.1.2 Benefits to Users

- Users benefit from an immersive and interactive learning experience that goes beyond traditional methods, fostering deeper engagement and understanding of historical concepts.
- Users gain exposure to culturally diverse historical settings and perspectives
- Users can retain historical knowledge more effectively and develop a deeper comprehension of historical narratives.
- The interactive challenges and quests within the platform encourage users to apply critical thinking and problem-solving skills in a historical context.

- The platform supports multi-user environments, enabling collaborative learning experiences where users can exchange ideas and insights with peers.

6.2 Problems and Limitations

- The project may face challenges related to VR hardware requirements. Based on limitations of Oculus Quest 2, some scripts in Spatial do not support VR headset now. For example, quest tasks do not show on the user's UI.
- Creating historically accurate and engaging content for the platform may pose challenges in terms of research, content curation, and balancing educational value with technological innovation.
- The challenges of using spatial scripts in VR tools are complex, including debugging and optimizing script performance.

6.3 Future Work

- Expanding content and features. There is potential to expand the platform's content with additional historical periods, events, and interactive features to offer users a broader range of learning experiences.
- Conducting further research and evaluation studies can provide insights into the platform's effectiveness in achieving educational objectives
- Future work could focus on refining the VR platform based on enhancing features, content, and usability to meet evolving educational needs.
